I. Introduction

The State of Oklahoma Department of Environmental Quality (ODEQ) is tasked by the Environmental Protection Agency (EPA), as authorized by CERCLA and as amended by SARA, under the Multi-Site Cooperative Agreement (CA# V-00645-01) to conduct a preliminary assessment (PA) of the historic Lorraine Refinery site, CERCLIS ID: not yet assigned. The principle purpose of this PA is to assess the immediate or potential impact to public health and the environment as a result of wastes from the Lorraine Refinery. The information collected for the PA can be employed to establish the need for further action under CERCLA/SARA. The scope of this investigation includes the review of available information from DEQ and other state agencies' files, a comprehensive target survey, and an on-site reconnaissance.

II. Site Description, Operational History, and Waste Characteristics

Site Description

The Lorraine Refinery site is located in NW ¼ NW1/4 of S29 T16N R9E and the SW corner of S20 T16N R9E in Creek County, Oklahoma. The site's center has the coordinates 35° 50' 33.37" north latitude and 96° 23' 09.06" west longitude. The site covers approximately 15 acres (Reference 1, 2; Figure 1). The area is bounded to the south and east by the St. Louis and San Francisco Railroad, to the west by Sand Creek and highways 66 and 48, and the property extends 5.448 acres north of E0810 road. The property is divided into a northern portion and southern portion by E0810. The northern portion of the site is rural land that is no longer in use, while the southern portion of the

site is utilized by the First Assembly of God Church and one residence. Site access is not controlled. There are no fences on the property (Reference 3).

There are no schools or day cares located within 200 feet of the site. The church owning the property has two full time employees. There are 31 residences within a quarter mile of the site, as well as a hotel with 36 rooms, and an owner, his wife and two children all of whom live there full time. The drainage pattern of the southern portion of the site is primarily to the west and the drainage pattern for the northern portion of the site is to the south (Reference 3).

The site is the former location of the Lorraine Refinery, containing multiple storage tanks and refinery operation buildings. All refinery tanks and buildings have been leveled. The land is primarily pavement, church buildings, grasses, and trees. The southern portion of the site is outlined by trees and Sand Creek. There are multiple areas of stressed vegetation, barren areas, and visible black tarry waste deposits. The northern portion of the site is well vegetated, however the soil underneath the vegetation appears contaminated in addition to copious barren areas of black hard material of hydrocarbon nature (Reference 3).

The climate of Creek County is Humid Subtropical and has pronounced seasonal changes in temperature and, to a lesser extent, in precipitation. The prevailing winds are from the north from December to February and from the south during the rest of the year.

Summers are long and hot. Winters are short and comparatively mild. Spring and fall

are cool and usually windy. The precipitation is fairly well distributed during the year. The average annual precipitation in the area is about 37 inches. The 2-year, 24-hour rainfall is about 3.8 inches (References 4, 5).

Operational History

A detailed title search in the County Clerk office confirms that the property was used in oil refinery operations from 1915 until it was bought by the H. F. Wilcox Oil and Gas Company in 1937. The first recorded owner of the property was (b) (6). (b) (6) sold the property to an industrial owner, the Bristow Oil and Refining Company, which purchased the property in May of 1915. The property was then sold to the Continental Refining Company in September of 1916. (b) (6) then received the company in November 1921 and then the property was sold to the Lorraine Petroleum Company in July of 1923. At some point, the Lorraine Petroleum Company became the Lorraine Refining Company. The Lorraine Refining Company then sold the property to Interocean Oil Company in October of 1925. The property was then bought by the Producers Oil Company in February of 1929. The Producers Oil Company then sold the property to the H. F. Wilcox Oil and Gas Company in June of 1937 as part of an expansion process for the Wilcox refinery. According to a report by the ODEQ in 1994, the Wilcox company area then totaled 110 acres, all of which was sold to (b) (6) in November of 1963. After this, the property in question remained in private ownership (Reference 3).

Waste Characteristics

The Sanborn Insurance Map indicates that the property contained approximately 25 storage tanks of various sizes, a cooling pond, and around 10 buildings housing refinery operations. The map also indicated that crude oil, fuel oil, gas oil, distillate, kerosene, benzene, and benzene (petroleum ether) were all stored on the property by the Lorraine Refining Company (Reference 3).

There were no releases to the air or water observed nor any unusual odors detected during the on-site reconnaissance. However, (b) (6) a member of the church, testified that a hydrocarbon sheen is visible in the moisture on the ground upon digging 2 to 3 feet. The wastes associated with this type of facility include crude oil, tank residues, brine, acid and caustic sludges, heavy metals, petroleum products, coke, sulfur compounds, and solvents (Reference 3).

There are several areas of stressed vegetation, barren soil, and spots of tarry waste. In the southern portion of the property, the church and its parking lot appear to be where the refinery buildings were located. A barren area with gravel is located at the probable area of 10,000 gallon fuel tank on the Sanborn map, the area measuring 10 yards by 7 yards. Another area, likely the stills location, possessed barren areas measuring 33 yards by 6 yards. A third barren area exists in the former location of the wooden waste tank, measuring 6 yards by 6 yards. A fourth barren area exists at the likely tank sites, running from the tree line east to the church buildings. This area had visible black tarry waste and

bare spots scattered throughout. A fifth barren area exists in the NW corner of the property, measuring 37 yards by 15 yards (Reference 3).

In the northern portion of the property, barren areas containing hard, black hydrocarbon material were present throughout the property to the extent that their size could not be quantified. The location of the largest oil tank on the refinery property was estimated in the NE portion of the property due to the discovery of a very large barren area surrounded by trees that is visible in aerial photos (Reference 3; Figure 1).

III. Pathway and Environmental Hazard Assessment

Groundwater Exposure

According to the Creek County Soil Survey, the specific soil series on the Lorraine Refinery site are Stephenville and Darnell fine sandy loam with a 4-7 percent slope, oil waste land, and Verdigris silt loam (Reference 4).

The Stephenville and Darnell fine sandy loam, sloping, is a shallow upland soil that developed over reddish-yellow to red sandstone or interbedded sandstone and sandy shale. The parent materials were slightly acidic to neutral. The Stephenville Darnell fine sandy loam, sloping, are droughty and low in natural productivity. These soils are highly susceptible to erosion. About 60 percent of the acreage consists of Stephenville soils and 40 percent of Darnell soils. The Stephenville soil depth ranges from 20-40 inches. The first four inches of the Stephenville soil is a grayish-brown fine sandy loam with a weak

granular structure and slight acidity. From 4-12 inches, the soil is a pale-brown light fine sandy loam that is very friable when moist and loose when dry and maintains a slight acidity. From 12-28 inches, the soil is a yellowish-red sandy clay loam with massive structure. At this point the soil is crumbly and friable when moist and slightly sticky when wet. The soil is porous and permeable, and maintains a medium acidity. From 28-35 inches, the soil is a yellow-red sandy clay loam that is friable, permeable, and contains small, soft fragments of slightly weathered sandstone with medium to slight acidity. The bedrock typically begins at 35 inches and is a yellowish-red sandstone that is slightly acidic to neutral. The depth of the Darnell soil ranges from 5-20 inches. The Darnell soil is a pale-brown, light, fine sandy loam that is structure less and slightly acidic to a depth of about 10 inches. From 10-16 inches, the Darnell soil is a medium acidic, reddish-yellow fine sandy loam with a lower part that is slightly heavier and contains small fragments of partly weathered sandstone. Past 16 inches, the soil is a neutral reddish-yellow bedrock (Reference 4).

Oil-waste land is listed as having contamination by oil and saltwater waste from oil wells. This land is typically gullied and eroded and bare of vegetation (Reference 4).

The Verdigris silt loam is mapped on flood plains of streams. The parent material consisted of slightly acid to weakly alkaline alluvial sediments washed from dark soils of the prairies. Runoff is slow and internal drainage is moderate. The soil is flooded one to three times per year. The surface layer of soil runs about 16 inches deep, and is a dark grayish-brown silt loam that is friable when moist and hard when dry, and maintains a

slight acidity. From 16-36 inches, the soil is a dark grayish-brown clay loam that is crumbly and friable when moist and hard when dry. At this level, the soil is porous and permeable and maintains a slight acidity to neutral pH. From 36 inches on, the soil is a dark grayish-brown clay loam that is friable, permeable, and weakly alkaline (Reference 4).

The Lorraine Refinery sits on the Pennsylvanian-aged Barnsdall Formation. This formation is composed of fine-grained sandstone overlain by shale. Thickness ranges from 80 to 200 ft (Reference 6).

At approximately 0.25 miles to the southeast of the refinery, the underlying Pennsylvanian-aged Wann Formation and underlying Iola Limestone are exposed. The Wann Formation varies in thickness from 40 to 180 feet and is comprised of shale and fine- to medium-grained sandstone. The Iola Limestone ranges in thickness from 15 to 20 feet and consists of a calcareous fine-grained sandstone and limestone with some shale (Reference 6).

Sand Creek appears to be the major drainage basin for the site. Sand Creek flows southward along the western side of the Lorraine Refinery site and begins flowing to the southeast at the southern boundary of this site. At approximately 0.25 miles to the southeast of the refinery Sand Creek is associated with Quaternary-aged alluvial deposits consisting of sand, silt, clay, and lenticular beds of gravel. Thickness in these deposits

ranges from 5 to 50 feet (25 feet average). Because Sand Creek crosses the site, localized alluvium may be present at the refinery (Reference 6).

A field of eight wells, which may be the public water supply for Bristow, Oklahoma, is located approximately 1.5 miles south of the refinery site. The average well is 200 feet deep and has a water level at 45 feet. The average yield from these wells is 25 to 50 gallons per minute (gpm). Water quality, obtained from Pennsylvanian rocks, is good with 500 mg/L or less of dissolved solids (Reference 6).

The Lorraine Refinery is located 2 miles from Little Deep Fork Creek, which is associated with the alluvial and terrace deposits of a groundwater recharge area. These deposits range in thickness from 10 to 50 feet. The yields from these aquifers are, generally, 10 to 500 (gpm) of good quality (less than 1,000 mg/L dissolved solids) water. Little Deep Fork Creek flows to the southeast, draining into the Deep Fork River, a tributary of the North Canadian River (Reference 6).

Depth to shallow groundwater is 12 to 20 feet, according to records of monitoring wells located within two miles of the site. Based on regional topography, flow direction of surface and shallow groundwater is to the south/southeast (Reference 6).

The Lorraine Refinery is located on the border between the recharge and potential recharge area of a major bedrock aquifer - the Pennsylvanian, Vamoosa Formation and Ada Group, comprised of fine- to coarse-grained sandstone irregularly interbedded with

shale. A potential recharge area includes strata that may be in hydrological communication with the bedrock aquifer, so these regions should be protected as well as the recharge area proper. In 2000, 7.34 million gallons of freshwater per day were withdrawn from the Vamoosa-Ada groundwater aquifer, 75 percent of which was used for municipal purposes and 25 percent for rural domestic and stock animal consumption. This quantity is significant and represents 10 percent of the fresh groundwater withdrawal in Oklahoma for this year (Reference 6).

There are 10 public wells within the 4-mile radius of the site. Because of the Lorraine Refinery's adjacent position to the Wilcox Refinery, the estimated population served by these public wells can be obtained from the previously completed Wilcox Preliminary Assessment. The population served by these wells is described in the following table.

Public Wells

Distance from Site (mi)	# of Wells	Est. Population Served by Public Wells
On-site	0	0
0 – ¼	1	0
¼ – ½	0	0
½ – 1	1	165
1 – 2	8	4301
2 – 3	0	0
3 – 4	0	0
Total	10	4466

The total population served by private wells is described in the table below. The numbers were arrived at by multiplying the number of wells by the estimated average number of persons (2.53) per household in Creek County (References 7, 8, 9)

Private Wells

Distance from Site (mi)	# of Wells	Est. Population Served by Public Wells
On-site	1	2.53
0 – ¼	1	2.53
¼ - ½	3	7.59
½ - 1	9	22.7
1 - 2	45	113.85
2 – 3	47	118.91
3 – 4	75	189.75
Total	181	4466

Surface Water Exposure

The drainage pattern for the northern portion of the site is to the south. The drainage pattern for the southern portion of the site is generally west. One perennial stream exists on the site which flows east to west and links into Sand Creek. This point where the perennial stream joins Sand Creek is likely the most significant probable point of entry (PPE). The PPE occurs in the NE corner of the NE corner of S30 T16N R9E (Reference 2, 3; Figure 3). Sand Creek meanders approximately 2 miles east until it merges with Little Deep Fork Creek, which is the third surface water body within fifteen miles downstream of the PPE.

According to gauging station #07243500 located in the NW ¼ of the SW ¼ of S20 T14N R12E in Okmulgee County, approximately 25 miles southeast from the site, the annual flow rate of the Deep Fork River is 806 cfs (Reference 7).

The average annual precipitation in the area is about 37 inches. The 2-year, 24-hour rainfall is about 3.8 inches (References 4, 5). The site is not located within the 100-year flood plain (Reference 11).

According to the State of Oklahoma, Sand Creek is considered a Habitat Limited Aquatic Community, and a Secondary Body Contact Beneficial Use, as well as having agricultural and aesthetic beneficial uses. Little Deep Fork Creek downstream from Sand Creek is considered a Warm Water Aquatic Community, and a Primary Body Contact Beneficial Use, as well as having agricultural and aesthetic beneficial uses (Reference 13).

The Oklahoma Department of Wildlife Conservation lists the Heyburn Wildlife Management Area within the 15-mile target distance. This area and its associated watershed are considered to be sensitive areas (Reference 14).

There are ecological systems of importance within a 4-mile radius of the site. Habitats of the endangered, threatened, and special concern species listed below are known to occur at or near the site (Reference 14).

Endangered, threatened, and special concern species

Federal Status	State Status	Scientific Name	Common Name
Mammals			
-	SS2*	<i>Marmota monax</i>	Woodchuck
Insects			
-	SS2*	<i>Gryllotalpa major</i>	Prairie Mole Cricket
Endangered	Endangered	<i>Nicrophorus americanus</i>	American Burying Beetle
Birds			
Endangered	Endangered	<i>Sterna antillarum</i>	Interior Least Tern
-	SS2*	<i>Aimophila aestivalis</i>	Bachman's Sparrow

*SS2 – A species identified by technical experts as possibly threatened or vulnerable to extirpation but for which additional information is needed.

Soil Exposure

There are no schools or daycares within 200 feet of the site. There are two full time employees working for the First Assembly of God Church which is located on the site. There are two residences on the site, which would be considered the nearest residents, and there are 141 residents within ¼ mile of the site (Reference 3). Visible waste was seen, approximately 859 square yards. The two on-site residents are considered primary targets for the purpose of the PA. All other targets under the soil exposure pathway are considered secondary.

Air Exposure

A particulate release to the air is suspected from any contaminated source, which maybe onsite, however no release was observed upon site reconnaissance (Reference 3). The estimated population and the wetland acreage within a 4-mile radius of the site are described in the table below. The wetland acreage was obtained from the ODEQ GIS database as well as from the U.S. Fish and Wildlife Association (<http://wetlandsfws.er.usgs.gov>).

Wetland acreage

Distance from Site (mi)	Est. Population	Est. Wetland Acreage
On-site	5	5.37
0 – ¼	143	11.03
¼ - ½	502	7.18
½ - 1	2185	49.75
1 – 2	2042	183.43
2 – 3	251	339.88
3- 4	826	204.62
Total	5939	795.89

The population targets onsite and within the ¼ mile radius under this pathway are considered to be the primary targets. All other targets under the air pathway are considered secondary for the purpose of this PA.

IV. Summary and Conclusion

The Lorraine Refinery site is a historical refinery in Bristow, Creek County, Oklahoma. The site passed through various refinery corporations from 1915 through 1937. The site is now divided among two parties- the First Assembly of God Church and (b) (6)

Most of the site is well vegetated with trees, brushes, and grass; however there are multiple areas of barren soil and visible wastes. The total area of contaminated soil is estimated at approximately 859 square yards.

Habitats of the endangered or threatened species listed are known to occur near the site, as well as a nearby Wildlife Management Area. There is a possibility that contaminants could migrate from the areas of contaminated soils via groundwater and surface water runoff toward Sand Creek and the Little Deep Fork Creek. As a result of the information gathered during this PA, further investigation of this site is recommended.

MEMORANDUM

September 12, 2008

To: Lorraine Refinery PA File

From: Vanessa Peterson, Technical Intern

Re: Current Ownership of said property, Potentially Responsible Parties (PRP) search, and Site Reconnaissance

The Lorraine Refinery Site, as addressed under the given name by the Sanborn Insurance Map of 1923, is located on the northwest quarter of the northwest quarter of Section 29, Township 16 North, Range 9 East; and also the southwest corner of Section 20, Township 16 North, Range 9 East. The site has the coordinates of 35° 50' 33.37" latitude and 96° 23' 09.06" longitude, and the property lies north and west of the St. Louis and San Francisco Railroad right-of-way in Creek County, Oklahoma. The property contains 15.032 acres. The property is divided into a northern portion and southern portion by a county road (currently E0810 Road), and is bordered by the railroad to the east and south while Sand Creek borders a portion of the property to the west. The site visits were conducted in April 2008, and July 2008.

According to the Sanborn Map, the southern portion of the property was the operational facility and some storage tanks, while the northern portion was primarily storage tanks. Currently, the First Assembly of God Church in Bristow owns the

property, and according to the aerial maps, the church buildings and parking lot appear to be built in the area where the refinery buildings were located in the southern portion of the property. A house belonging to the pastor of the church is located on the southwestern portion of the property. Undeveloped property occupies the northern portion of the property, previously housing the storage tanks.

A search concerning the current ownership of a property formerly occupied by the Lorraine Refining Company located in NW corner of the NW corner of S29 T16N R9E and the SW corner of S20 T16N R9E in Creek County, Oklahoma was conducted by the Creek County Assessor's office whose records indicate that the site belongs to two owners, the First Assembly of God Church and (b) (6) (b) (6)

A detailed title search in the County Clerk's Office indicated that one of the first owners of the site was (b) (6) (b) (6) sold the property to an industrial owner, the Bristow Oil and Refining Company, which purchased the property in May of 1915 (book 112, page 644). The property was then sold to the Continental Refining Company in September of 1916 (book 130, page 604). (b) (6) then received the company in November 1921 (book 271, page 388) and then the property was sold to the Lorraine Petroleum Company in July of 1923 (book 271, page 388). At some point, the Lorraine Petroleum Company became the Lorraine Refining Company. The Lorraine Refining Company then sold the property to Interocean Oil Company in October of 1925 (book 309, page 401). The property was then sold to the Producers Oil Company in February of 1929 (book 371, page 265). The Producers Oil Company then sold the

property to the H. F. Wilcox Oil and Gas Company in June of 1937 (book 402, page 432) as part of an expansion process for the Wilcox refinery. According to a report by the ODEQ in 1994, the Wilcox company area then totaled 110 acres, all of which was sold to (b) (6) in November of 1963. After this, the property in question remained in private ownership, and is currently in possession by the First Assembly of God Church.

There are no schools or daycares located within 200 feet of the site. The church, located on the site, maintains three employees, 2 full-time. The Carolyn Inn hotel is located within ¼ mile of the site. The inn has 36 rooms while 2 adults and 2 children living there full-time. There are 31 residences located within ¼ mile of the site. Sand Creek borders the west portion of the property. Sand Creek is a small perennial tributary of the Little Deep Fork Creek; it enters Little Deep Fork approximately 3.5 miles downstream of the probable point of entry (PPE). Drainage of the site is primarily to the west, into Sand Creek. During heavy rain, a small perennial stream forms which flows west through the property and eventually joins Sand Creek at the west edge of the property.

The site is a former refinery plant with approximately 25 storage tanks of various sizes, a cooling pond, and around 10 buildings housing refinery operations. All of the refinery buildings have been leveled and replaced with the buildings of the current church. All of the storage tanks have also been leveled. The approximate location of the tanks can be estimated using the Sanborn Maps and noting the location of barren spots of soil.

There were no releases to the air or water observed nor were any unusual odors detected during the on-site reconnaissance. The property was divided into two portions, a southern and a northern, by E0810 road. The reconnaissance of the southern portion revealed five barren areas of soil in, many containing spots of tarry waste. (b) (6), a member of the First Assembly of God Church for over 20 years, stated that four inches of crude oil were discovered when a cap was broken off an existing pipeline. (b) (6) also stated that a well dug in 1991 was capped in 1992 due to oil contamination of the water. (b) (6) also testified that a hydrocarbon sheen on moisture in the ground is visible upon digging 2 to 3 feet. The church often discovers into concrete when digging, most likely due to foundations left over from the refinery. The wastes assumed to be associated with this type of facility include crude oil, tank residues, brine, acid and caustic sludges, heavy metals, petroleum products, coke, sulphur compounds, and solvents.

The northern portion of the property contains parts that are well vegetated with bushes, trees, and long grass. The probable refinery site is bordered by the railroad to the east, a road to the west, and a property fence to the north indicating the edge of the Yoder property. The (b) (6) house was the only building in current use located on the northern portion of the property. There are a number of old buildings located on the west-central portion, however these buildings are not in use and do not appear to have any relation to the refinery.

Although the area was well vegetated, under the vegetation contaminated looking soil is present that is black in color and has a tar like consistency. Also, copious barren spots with refinery remnants were present all throughout the northern portion of the property to the extent that their size could not be quantified. The barren spots primarily were made up of hard, black material of a hydrocarbon nature. In some locations, a black, tar like liquid was observed oozing through openings in the hard black spots. The Sanborn map indicates the former location the largest on the Lorraine Refinery, and its area is estimated by a large barren area surrounded by trees that is visible in aerial photos.

In the south-central region of the northern portion of the property there is a dike running west to east with a height of about 20 feet. The dike appears to be man-made; however it is of unknown origin. It does not appear to be related to the refinery, and its presence is not indicated on the Sanborn Map.

The general drainage pattern for the northern portion of the property is north to south. However, there are numerous low-lying depressions throughout the property that could collect surface water. At the time of reconnaissance, no intermittent streams were seen.

D E E D.

This indenture made this 22d day of May, A.D. 1915, between Joe Abraham and Fannie Abraham, his wife, of Bristow, Creek County, Oklahoma, parties of the first part, and the Bristow Oil and Refining Company, a corporation, of Bristow, Creek County, Oklahoma, party of the second part;

WITNESSETH: That the said parties of the first part for and in consideration of the sum of six thousand and five hundred dollars (\$6,500.00), cash in hand paid, the receipt whereof is hereby acknowledged, do by these presents grant, bargain, sell and convey unto said party of the second part, the Bristow Oil and Refining Company, its assigns and successors, all that certain tract or parcel of land with the buildings thereon standing situated about one mile north of the town of Bristow, in the county of Creek, State of Oklahoma, and more particularly described as follows, to wit:

All that part of the North-west quarter (NW-4) of the North-west quarter (NW-4) of Section Twenty-nine (29), Township Sixteen (16) North, Range Nine (9) East, lying north and west of the St. Louis and San Francisco Railroad right-of-way in Creek County, State of Oklahoma, containing about seven and one-half (7 1/2) acres, more or less;

Together with the buildings, improvements, machinery and gasoline plant thereon located and the appurtenances thereunto belonging; also two certain wooden oil tanks and a quantity of galvanized iron drums used for the conveyance of gasoline, being all the drums except 165 located at Coalton, and owned by C.D. Webster Oil Company and located in various towns and cities in the State of Oklahoma and elsewhere;

To have and to hold the same, together with all and singular the tenements, hereditaments and appurtenances thereunto belonging or in any wise appertaining, forever;

It being the purpose and intention of the parties of first part to convey to the party of the second part, the said Bristow Oil and Refining Company, all the right, title and interest in and to said property acquired by Joe Abraham under and by virtue of a certain trustee's deed of May 19th, 1915, from C.J. Benson as trustee in bankruptcy of C.D. Webster Oil Company, bankrupt, to Joe Abraham, as recorded in the Office of the County Clerk of Creek County, Oklahoma, May 25th, 1915, and as the same appears of record in Book 111, at page 575 of the records of the said County Clerk.

In witness whereof the said parties of the first part have hereunto set their hands the day and year first above written.

Joe Abraham
Fannie Abraham.

INTERCOMER OF COMPANY

TO

THE COMPANY TRUST COMPANY OF BALTIMORE
AT BALTIMORE

DEED OF TRUST

Dated July 1st, 1925

BEFORE ME, the undersigned, a Notary Public within and for the State of Maryland,

WITNESSETH, that on the 1st day of July, 1925,

between the said Company and

INTERCOMER OF COMPANY

DEED OF TRUST

THIS INTERCOMER, made and entered into on the 1st day of October nineteen hundred and twenty-five, of the 1st day of July, nineteen hundred and twenty-five; and between Intercomer Oil Company, a corporation organized and existing under and by virtue of the laws of the State of Delaware, and hereinafter called the "corporation," party of the first part and the Century Trust Company of Baltimore, a corporation organized and existing under the laws of the State of Maryland, hereinafter called the "trustee," party of the second part;

WHEREAS, the Corporation has full power and authority to issue negotiable bonds and to secure the payment of such bonds and to mortgage all of its property, real and personal, wherever situated; and

WHEREAS, the Corporation desire now to make and issue its First Mortgage Ten Year 7% Convertible Sinking Fund Gold Bonds of which the aggregate amount outstanding at any one time shall never exceed the principal sum of Two Million (\$2,000,000) Dollars, all of which bonds are to be issued under and in pursuance of, and are to be secured by this Indenture; and

WHEREAS, the said First Mortgage Ten Year 7% Convertible Sinking Fund Gold Bonds shall be issued in one or more series, and shall be issued in denominations of One Thousand Dollars each, as provided in this Indenture, to be numbered from 1 to 2000, inclusive; and

WHEREAS, all of the bonds are to bear interest at the rate of Seven per cent (7%) per annum, payable semi-annually on the first days of January and July in each year and shall be due and payable on the first day of July in the year nineteen hundred and thirty-five; and

WHEREAS, such of said bonds shall be redeemable at any interest payment date before maturity by the Corporation, by payment of the principal and accrued interest

UNITED STATES OF AMERICA
DEPARTMENT OF JUSTICE
INTERNAL SECURITY - RACIAL MATTERS

3.443

.....

[illegible]

On 12/1/68, the parties entered into the "First" portion of the interest payment plan before maturity upon the original note. Pursuant to the principal and interest thereon and a premium to be collected as follows:

The first \$250 is redeemed on or before July 1st, 1970, \$200 on the 1st of July 1st, 1971, and on or before July 1st, 1972; the remaining \$250 is redeemed on or before July 1st, 1973; and the parties have agreed that on or before July 1st, 1974, all as provided in the said indenture.

To recover shall a fee, on the account of the principal or interest of the said contract, be levied, a third of three of the Corporation, to be paid at intervals of six months, by the said Corporation, and the liability of stockholders, limited to the extent of the Corporation's liability, by the receipt of the said fee.

[illegible]

Such modification however, shall not affect the transferability of the coupons for the interest hereon, by delivery thereof, and payment to the holder thereof shall constitute the corporation in respect to the interest therein secured, whether or not the same is so stated.

Neither this bond nor any coupon for interest thereon shall become or be valid until the same shall have been authenticated by the certificate endorsed hereon and duly signed by the Trustee under said indenture period. In witness whereof, Inter-ocean Oil Company has caused these presents to be signed by its President or one of its Vice-Presidents, and such certificate shall be separate attested, and to be attested by its Secretary or its Assistant Secretary, and coupon or such interest bearing the face-value of the same shall be attached hereto, as of the first day of July 1921.

Inter-ocean Oil Company
Attest:..... Secretary
By..... President
(Corporate Seal)

(Form of Interest Coupon)
No..... \$35.00

On the first day of 19..... Inter-ocean Oil Company, will pay to the bearer at the office of The Century Trust Company of Baltimore, in the City of Baltimore or at the office of the Mechanics and Farmers National Bank in New York City, at the latter action unless the bond to which this coupon is annexed shall have been previously redeemed or converted, Fifty-five (\$35.00) Dollars in the United States Gold Coin without deduction for the taxes specified in said bond, being a semi-annual interest then due on its first mortgage ten Year 7% Convertible, First Mortgage Bond No.

Trustee.....

(Form of Trustee Certificate)

This is to certify that this bond is one of the bonds referred to in the within mentioned indenture.

The Century Trust Company
of Baltimore
By..... Assistant Secretary.

AND WHEREAS, at a meeting of the stock holders of the Corporation duly called and held, the holders of all outstanding stock of the Corporation by their vote, duly authorized the creation of this indenture and the issue of the bonds hereby secured, as herein provided; and

WHEREAS, at a meeting of the Board of Directors of the Corporation said Board of Directors duly authorized the form of this Indenture and did resolve that in behalf of the Corporation, this Indenture be executed by its President or a Vice-President and that the corporate seal be affixed thereto and be attested by its Secretary or an Assistant Secretary; and that this Indenture be countersigned and delivered to the Century Trust Company of Baltimore as Trustee; that the Board of the Corporation substantially of the tenor and effect set forth in this Indenture be executed from the time of the date and behalf of the Corporation by the President or Vice-President and the Secretary or Assistant Secretary of the Corporation; and such bonds be issued, certified and delivered in accordance and upon the terms and conditions and for the purposes set forth in this Indenture; and

WHEREAS, all acts and things required by law under the By-Laws of the Corporation and conditions precedent to the execution of this Indenture and the issue of the bonds hereby secured, have been duly performed, and the Corporation has executed this Indenture and has issued and delivered to the Trustee for certification the bonds hereby secured, in the exercise of such and every legal right and power as it is entitled to;

AND WHEREAS, this Indenture witnesseth that in order to secure the payment of the principal and the interest of a certain first mortgage ten Year 7% convertible sinking fund gold bonds of the Corporation at and time issued and outstanding under this Indenture, and in consideration of the premises and of the covenants and performances of such bonds by the holders thereof, and of the sum of One Dollar to it duly paid by the Trustee, the receipt whereof is hereby acknowledged,

The Corporation, party of the first part hereto, has granted, bargained, aliened, conveyed, sold, assigned, transferred and set over, and does hereby grant, bargain, alien, convey, sell, assign, transfer and set over, unto the Trustee party of the second part hereto, and its successors in the trust hereby created the following is called hereafter, viz.

IN THE STATE OF MARYLAND
1- Curtis Bay.

All those four parcels of land in Baltimore City, formerly in Anne Arundel County:

(1) Beginning for the first parcel at a point where a stone was formerly planted on the Southwest side of the right of way of the Sea Wall Branch of Baltimore and Ohio Railroad and in the division line between the land formerly of the heirs of Robert F. Crisp now belonging to The Prudential Oil Company and land formerly belonging to Curtis Bay Company now belonging to United States Asphalt Refining Company, and running thence binding on said division line south seventy-nine degrees and twenty-six minutes west one thousand three hundred and twenty-two feet and three inches; thence binding on the line of other land belonging to The Prudential Oil Company and

Continental Refining Company, a corporation, et al., were defendants, appearing J. L. Redford, Receiver of the said Continental Refining Company, and the said J. L. Redford thereafter with qualified as such Receiver and entered upon the discharge of his duties, and,

THE 21, thereafter, to wit, on the 23rd day of December, 1932, an order was entered by the said court in the said case directing the said Receiver to sell the property of the said Continental Refining Company, hereinafter described, and,

THE 21, thereafter, to wit, on the 23rd day of June, 1933, in accordance with the said order of December 23, 1932, having first given notice of the said sale and having had the said property appraised in accordance with the terms of the said order, the said Receiver did offer the said property for sale and did sell the same to the Lorraine Petroleum Company of Tulsa, Oklahoma, for the sum of Twenty-Five Thousand Dollars (\$25,000.00) in cash, and,

THE 21, thereafter, to wit, on the 18th day of July, 1933 the said sale was only confirmed by the said District Court of Creek County, (Oklahoma), and the said Receiver was authorized and directed to execute and deliver his deed therefor to the said Lorraine Petroleum Company upon the payment to the said Receiver of the sum of Twenty-Five Thousand Dollars (\$25,000.00) in cash,

For which J. L. Redford, Receiver of the Continental Refining Company, a corporation, acting as the first part, in consideration of the sum of Twenty-Five Thousand Dollars (\$25,000.00) cash in hand paid, the receipt of which is hereby acknowledged, does hereby certify, grant, warrant, sell and convey unto the Lorraine Petroleum Company of Tulsa, Oklahoma, parts of the second part, the following described real property and premises, situate in Creek County, State of Oklahoma, to-wit:

That part of the Northeast Quarter of the Northeast Quarter 14th North and East of the line of the Chicago Railway Company in Section 18, Township 16 North, Range 9 East, in the County of Creek, and State of Oklahoma, being a tract of ground comprising approximately seven and one-half (7-1/2) acres, together with the refinery, stills, pump houses, boiler houses, and other buildings, loading racks, tracks and tanks upon the premises.

A certain leasehold covering approximately twenty-three and six tenths (23.6) acres in the East Half of the Northeast Quarter of Section 18, Township 16 North, Range 9 East, County of Creek and State of Oklahoma, particularly described as follows, to-wit: Beginning at the southeast corner of Section 25, Township 16 North, Range 9 East, running thence North 1900 feet; thence East 710 feet; thence South 13 degrees East 80 feet to the right-of-way of the St. Louis and Northern Railway; thence along the said right-of-way 100 feet; thence along the said right-of-way 900 feet to where the said right-of-way intersects the South line of a 1/4 section 18; thence East 275 feet to the place of beginning, containing twenty-three and six tenths (23.6) acres, more or less, used by the Continental Refining Company as a tank farm.

The rights of the Continental Refining Company in and to three tracts of land situated in the County of Creek and State of Oklahoma, wherein are located the pump station of the Continental Refining Company, together with all of the buildings, boiler houses and equipment now located thereon, said tracts of land being described as follows, to-wit:

(a) A tract of land containing approximately five (5) acres, located on the East Half of the East Half of Section 18, Township 16 North, Range 9 East, more being known as the Little Branch Pump Station.

(b) Approximately five (5) acres of land located in Lot Three (3) in the Northeast Quarter of Section 17, Township 16 North, Range 9 East, more being known as the High Bay Pump Station.

(c) Approximately one (1) acre of land located in the East Half of the North-east Quarter of Section 18, Township 16 North, Range 9 East, more being known as the Joseph Lake Station.

The rights of the Continental Refining Company in and to the lands located in Creek County, Oklahoma together with the oil pipe lines of the Continental Refining Company located thereon, to-wit: Approximately seven and one-half (7-1/2) acres of three (3) inch line running from the High Bay Pump Station on through the Little Branch Pump Station and on through to the Little Branch Station, in Creek County, Oklahoma.

Together with all now situated thereon, hereditarily and otherwise, belonging to the above named company, or in any wise thereto in any way.

Also the following described personal property now located on the above described premises, to-wit:

All tanks located on the land farm above described, being: 1-10,000 barrel steel oil tank, four 100 barrel steel oil tanks, and 14-1000 barrel steel oil tanks, and all accessories thereto belonging.

Also all office furniture, machinery, and machines, pipe fittings, tanks, valves, tools of every kind and description, and all other personal property of like kind and kind or use on the premises of the refinery of the Continental Refining Company near Winton, in Creek County, Oklahoma, and owned by the said Continental Refining Company.

To have and to hold said described premises unto the said part, of the said part, its successors and assigns forever, the said property being sold free from liens.

Dated and delivered this 11th day of May, 1927

J. F. Lockford

THIS INSTRUMENT, Made this first day of October A.D. 1925

Lorraine Refining Company, a corporation of Tulsa party

and coming to the State of Oklahoma of the first part, and

Interocean Oil Company, a Delaware Corporation, party

of the second part,

WITNESSETH, That ~~the said Lorraine Refining Company~~ in consideration of the sum of One (\$1.00) of which said party of the first part has hereby acknowledged, do hereby by these presents, Grant, Bargain, Sell and Convey unto said party of the second part its successors and assigns, all of the following described Real Estate, situated in the County of Creek, State of Oklahoma, to-wit:

That part of the NW $\frac{1}{4}$ of the NW $\frac{1}{4}$ lying north and west of the line of the Frisco Railway Company in Section 29, Township 16 N. Range 9 E. containing 7 $\frac{1}{2}$ acres of land more or less.

Revenue \$7.50 attached and cancelled.

TO HAVE AND TO HOLD THE SAME, Together with all and singular the tenements, hereditaments and appurtenances thereto belonging or in anywise appertaining, unto
And said Lorraine Refining Company and its successors

do hereby covenant, promise and agree to and with said party of the second part

that it is lawfully seized in its own right of an absolute and indefeasible estate of inheritance in fee simple, of and in all and singular the above granted and described premises, with the appurtenances; that the same are free, clear and discharged and unincumbered of and from all former and other grants, titles, charges, estates, judgments, taxes, assessments and incumbrances, of what kind and kind.

the successors of the second part do hereby warrant and defend the same unto said party of the second part its successors and assigns, and all and every person or persons whomsoever, lawfully claiming or to claim the same.

IN WITNESS WHEREOF, The said party of the first part has hereunto set its hand, the day and year first above written.

Attest: I. H. Patton, Jr.
Assistant Secretary (CORP SEAL)

Lorraine Refining Company
By Geo. W. Snedden
Vice President.

REAL ESTATE MORTGAGE

THIS INDENTURE WITNESSETH, That **FIRST ASSEMBLY OF GOD, INC.**, an Oklahoma not-for-profit Corporation of Creek County, State of Oklahoma ("Mortgagor"), MORTGAGE(S) AND WARRANT(S) to **ASSEMBLIES OF GOD FINANCIAL SERVICES GROUP**, a Missouri not-for-profit Corporation (the "Mortgagee") of Greene County, State of Missouri, the following described real estate in Creek County, Oklahoma:

SEE ATTACHED SCHEDULE "A"

and commonly known as: 35146 West 221st Street South, Broken Arrow, OK (hereinafter referred to as the "Real Estate") together with all rights, privileges, interests, easements, hereditaments, appurtenances, fixtures and improvements now or hereafter belonging, appertaining, or attached to, or used in connection with, the Mortgaged premises, and owned by Mortgagors including, but not in limitation of the preceding, all gas, water and electric fixtures, radiators, heaters, fixtures, water heaters, air conditioning apparatus and parts, refrigerating equipment, refrigerators, cooking apparatus, windows, screens, awnings, storm sash, doors and carpentry (which are or shall be attached to such building, structures or improvements), partitions, machinery, cranes, equipment, personal property of every kind and nature whatsoever now or hereafter owned by First Assembly of God Inc. and its successors.

02 1112

REAL ESTATE MORTGAGE

THIS INDENTURE WITNESSETH, that **FIRST ASSEMBLY OF GOD, INC.**, an Oklahoma not-for-profit Corporation of Creek County, State of Oklahoma ("Mortgagor"), MORTGAGOR(S) AND WARRANT(S) to **ASSEMBLIES OF GOD FINANCIAL SERVICES GROUP**, a Missouri not-for-profit Corporation (the "Mortgagee") of Oregon County, State of Missouri, the following described real estate in Creek County, Oklahoma:

SUB ATTACHED SCHEDULE "A"

and commonly known as: 35146 West 221st Street South, Bristow, OK hereinafter referred to as the "Real Estate" together with all rights, privileges, interests, easements, hereditaments, appurtenances, fixtures and improvements now or hereafter belonging, appertaining, or attached to, or used in connection with, the Mortgaged Premises, and owned by Mortgagor including, but not in limitation of the preceding, all gas, water and electric fixtures, radiators, heaters, fixtures, water heaters, air conditioning apparatus and units, refrigerating equipment, refrigerators, cooking apparatus, window screens, awnings, storm sash, doors and carpeting (which are or shall be attached to such building, structures or improvements), partitions, machinery, stoves, equipment, personal property of every kind and nature whatsoever now or hereafter owned by First Assembly of God Inc., and located in, on or about, or used in connection with the Real Estate, whether physically attached to the Real Estate or not hereinafter collectively referred to as the "Mortgaged Premises" and all the rents, issues, income and profits thereof and it is agreed that all similar fixtures, appliances, apparatus, equipment or articles hereafter placed on such Mortgaged Premises by First Assembly of God, Inc., and owned by First Assembly of God, Inc., its successors or assigns, including all replacements or substitutions therefor, shall be considered as constituting part of such Mortgaged Premises, all to the use and benefit of Mortgagee, its successors and assigns.

This Real Estate Mortgage is given to secure the performance of the provisions hereof and the payment of a certain promissory note ("Note") **January 14, 2002** in the principal amount of Forty Five Thousand Dollars (\$45,000.00) with interest as therein provided and with a final maturity date of **January 14, 2022**.

Said principal and interest are payable as follows: One hundred eighty monthly installments of \$377.00 payable on the **14th** day of **February, 2002** and the same day of each succeeding month thereafter until the note is fully paid.

The Mortgagors jointly and severally covenant and agree with the Mortgagee that:

RECEIPT NO. 2271

1. **Payment of Indebtedness.** The Mortgagors shall pay to Mortgagee when due all indebtedness secured by this Real Estate Mortgage, on the dates and in the amounts as provided in the Note or in this Real Estate Mortgage, without resort to valuation and appraisement laws, and with attorneys' fees, which proceedings shall include all renewals, modifications and extensions thereof, and also such further sums as may be advanced or loaned by Mortgagee to Mortgagors, or any of their successors or assigns, together with interest thereon at such rate as shall be agreed upon.

2. **No Liens.** The Mortgagors shall not permit any lien of mechanics or material men to attach to and remain on the Mortgaged Premises for any part thereof for more than 45 days after receiving notice thereof from the Mortgagee.

3. **Repair of Mortgaged Premises, Insurance.** The Mortgagors shall keep the Mortgaged Premises in good repair and shall not commit waste thereon. The Mortgagors shall procure and maintain in effect at all times adequate insurance with insurance companies acceptable to the Mortgagee against loss, damage to or destruction of the Mortgaged Premises because of fire, windstorm, or other such hazards in such amounts as the Mortgagee may reasonably require from time to time, and all such insurance policies shall contain proper clauses making all proceeds of such policies payable to the Mortgagee and the Mortgagors as their respective interests may appear. All such policies payable to the Mortgagee shall be delivered to and retained by the Mortgagee until the indebtedness secured hereby is fully paid.

4. **Taxes and Assessments.** The Mortgagors shall pay all taxes or assessments levied or assessed against the Mortgaged Premises, or any part thereof, and when due, and before penalties accrue.

5. **Advancements to Protect Security.** The Mortgagee may, at its option, advance and pay all sums necessary to protect and preserve the security intended to be given by this Real Estate Mortgage. All sums so advanced and paid by the Mortgagee shall be payable upon demand or shall become a part of the indebtedness secured hereby, at the election of the holder, and shall bear interest from the date or dates of payment at the rate of nine and one-fourth per centum (9 1/4%) per annum. Such sums may include, but are not limited to, insurance premiums, taxes, assessments and liens which may be or become prior and senior to this Real Estate Mortgage as a lien on the Mortgaged Premises, or any part thereof and all costs, expenses, and attorneys' fees incurred by the Mortgagee in respect of any and all legal or equitable proceedings which relate to this Real Estate Mortgage or to the Mortgaged Premises.

6. **Default by Mortgagors, Remedies of Mortgagee.** Upon default by the Mortgagors in any payment provided for hereunder in the Note, trustee or receiver is appointed in any bankruptcy action, then and in any such event, the entire indebtedness secured hereby shall become immediately due and payable at the option of the Mortgagee, without notice, and this Real Estate Mortgage may be foreclosed accordingly. Upon such foreclosure the Mortgagee may continue the abstract of the title to the Mortgaged Premises, or obtain other appropriate relief, and may add the cost thereof to the principal balance due.

272

7. **Non-Waiver, Remedies Cumulative.** Time is of the essence in the performance of obligations hereunder. No delay by the Mortgagee in the exercise of any rights hereunder shall preclude the exercise thereof so long as the Mortgagors are in default hereunder, and no failure of the Mortgagee to exercise any rights hereunder shall preclude the exercise hereof in the event of subsequent default by the Mortgagors hereunder. The Mortgagee may enforce any one or more of the rights or remedies hereunder separately or concurrently.

8. **Extensions, Reductions, Renewals, Continued Liability of Mortgagors and Guarantors.** The Mortgagee, at its option, may extend the time for the payment of the indebtedness, including the payments thereon, or accept a renewal note or notes therefore without consent of any person (the holder, past or present) of the Mortgagors if the Mortgagors have then parted with title to the Mortgaged Premises. No such extension, reduction or renewal shall affect the priority of this Real Estate Mortgage as against the rights hereof in any manner whatsoever, or release, discharge or affect in any manner the liability of any of the Mortgagors and Guarantors(s), if any, to the Mortgagee.

9. **General Agreement of Parties.** All rights and obligations hereunder shall extend to and be binding on all successors, assigns and heirs of the parties to this Real Estate Mortgage.

7. **Non-Waiver, Remedies Cumulative.** Time is of the essence in the performance of obligations hereunder. No delay by the Mortgagee in the exercise of any rights hereunder shall preclude the exercise thereof so long as the Mortgages are in default hereunder, and no failure of the Mortgagee to exercise any rights hereunder shall preclude the exercise thereof in the event of subsequent default by the Mortgages hereunder. The Mortgagee may enforce any one or more of the rights or remedies hereunder successively or concurrently.

8. **Extensions, Reductions, Renewals, Continued Liability of Mortgagors and Guarantors.** The Mortgagee, at its option, may extend the time for the payment of the indebtedness, or reduce the payments thereon, or accept a renewal note or notes therefore without consent of any junior lien holder, and without consent of the Mortgagors if the Mortgagors have then parted with title to the Mortgaged Premises. No such extension, reduction or renewal shall affect the priority of this Real Estate Mortgage or impair the security hereon in any manner whatsoever, or release, discharge or affect in any manner the personal liability of the Mortgagors and Guarantors, if any, to the Mortgagee.

9. **General Agreement of Parties.** All rights and obligations hereunder shall extend to and be binding upon the several heirs, representatives, successors and assigns of the parties to this Real Estate Mortgage. When applicable, use of the singular form of any word also shall mean or apply to the plural and the masculine form shall mean and apply to the feminine or the neuter. The titles of the several paragraphs of this Real Estate Mortgage are for convenience only and do not define, limit or construe the contents of such paragraphs.

SOIL SURVEY

Creek County Oklahoma

UNITED STATES DEPARTMENT OF AGRICULTURE
Soil Conservation Service
In cooperation with the
OKLAHOMA AGRICULTURAL EXPERIMENT STATION

SOIL SURVEY OF CREEK COUNTY, OKLAHOMA

By HARVEY OAKES, Soil Survey; ¹ soils surveyed by O. H. BRENSING, in charge, DALE SCRIVEN, and E. C. TALLEY, Oklahoma Agricultural Experiment Station; H. P. MIKLES, Soil Conservation Service; H. M. GALLOWAY, Soil Survey and Oklahoma Agricultural Experiment Station

Correlation by JAMES THORP, Soil Survey, United States Department of Agriculture

United States Department of Agriculture in Cooperation with the Oklahoma Agricultural Experiment Station

Geography of Creek County

Creek County is in the northeastern quarter of Oklahoma (fig. 1). It is about 72 miles south of the Oklahoma-Kansas boundary and about 96 miles west of the Oklahoma-Arkansas boundary. Sapulpa, the county seat, is in the northeastern corner of the county. It is 15 miles southwest of Tulsa and 87 miles northeast of Oklahoma City.

The county is 36 miles long from north to south and 33 miles across at the central and widest part. It is 24 miles across at the south end. All boundaries of the county are artificial. Most of the county lies between the Cimarron River on the north and the Deep Fork of the North Canadian River on the south. Small parts lie

shales, which erode more rapidly than the sandstones, occupy the shallow valleys. The ridges are capped by the more resistant sandstones.

The western part of the county is underlain mostly by sandstones. Streams have cut narrow V-shaped valleys. Much of this part of the county is rolling or sloping. The eastern and southeastern parts are underlain mostly by shales. The few beds of sandstone outcrop on ridges between the shallow, gently sloping or nearly level, shaly valleys.

The elevation is highest in the western part of the county. The altitude near Drumright, at the western edge, is about 1,100 feet. The altitude is lowest—about 600 feet—where the Deep Fork River leaves the southeastern corner.

The Cimarron River cuts across the north end of Creek County. Polcat Creek lies south of that river. These two streams drain the northern half of the county. Both are tributaries of the Arkansas River, which flows just northeast of Creek County. The Deep Fork of the North Canadian River, locally called the Deep Fork River, flows generally along the southern edge of the county and crosses the boundary a number of times. Together with Little Deep Fork Creek, which rises in the west-central part of the county, this river drains the southern half of the area. These two streams join just outside the county and flow into the North Canadian River about 50 miles to the southeast.

The county is well dissected by small streams, most of which have narrow valleys. The larger streams have rather wide, shallow valleys composed of narrow flood plains and nearly level terraces of old alluvium. All of the uplands and most of the bottom lands and terraces are well enough drained to be suitable for the common crops of the area. Only the flood plain of the Deep Fork River is so frequently flooded and so poorly drained as to prevent cultivation.

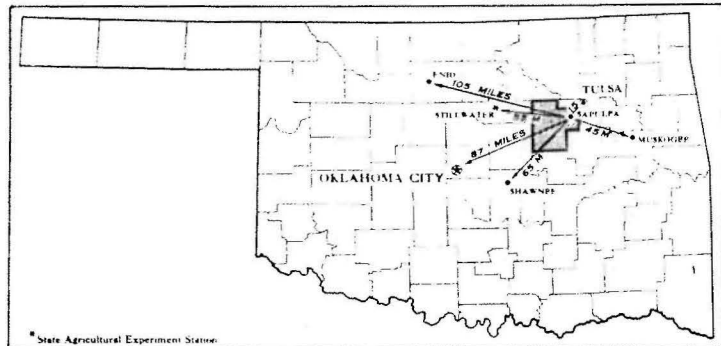

Figure 1.—Location of Creek County in Oklahoma.

north and south of these rivers. The approximate land area of Creek County is 972 square miles, or 622,080 acres.

Physiography, Relief, and Drainage

Creek County lies in the Osage Plains section of the Central Lowlands physiographic province. The Osage Plains, now a region of well-dissected sandstone hills, was formerly a gently sloping plain. Shallow narrow valleys separated by stony ridges are characteristic. The ridges lie roughly parallel in a northeast-southwest direction. Many of them have rather steep east-facing escarpments.

Creek County is underlain by interbedded sandstones and shales; each layer outcrops at its eastern edge. The

Climate

The climate of Creek County is continental and has pronounced seasonal changes in temperature and, to a lesser extent, in precipitation. It is generally warm to temperate and humid. There is a difference of about 40° F. between the average summer and the average winter temperatures. The prevailing winds are from the north from December to February and from the south during the rest of the year.

¹ Fieldwork for this survey was done while Soil Survey was part of the former Bureau of Plant Industry, Soils, and Agricultural Engineering. Soil Survey was transferred to the Soil Conservation Service on November 15, 1952.

Summers are long and hot. The highest temperatures are usually accompanied by clear skies, a moderately low humidity, southern breezes, and cooler nights. Winters are short and comparatively mild. They are characterized by periods of warm, pleasant weather followed by frequent but short spells of freezing temperatures accompanied by north winds. The ground sometimes is frozen to a depth of a few inches for several days. A few light snowfalls each winter total about 6 inches, but snow seldom remains more than a few days. Spring and fall are cool and usually windy. Tornadoes and hailstorms are rare.

The average growing season is about 219 days. The average date of the last frost in spring is March 27, but frosts have occurred as late as April 18. The average date of the first frost in the fall is November 1, but frosts have occurred as early as October 9. During normal years the growing season is long enough for all common field crops to mature. Some orchard crops, especially peaches, may be damaged by frosts late in spring. Planting of cotton or cowpeas is delayed in some years by late frosts and wet cool weather.

The average annual precipitation at Bristow, near the center of the county, is 37.19 inches. This amount of moisture is usually adequate for crops. The eastern edge

of the county receives about 2 inches more rainfall than the extreme western part. The precipitation is fairly well distributed during the year. About 60 percent of it comes during the planting and growing season, or between March 1 and September 1. April, May, and June have the highest rainfall. Dry spells lasting several weeks, accompanied by drying winds and a high evaporation rate, are common in July and August. These droughts may damage late crops, especially corn. September and October have more rain, but not so much as the spring months.

Fieldwork can go on throughout the winter, except for the short periods when the ground is frozen. Sometimes spring planting is delayed by cool wet weather. Heavy-textured soils, especially, may be too wet for planting early in spring.

The normal temperature and precipitation at Bristow are fairly representative for Creek County. These figures are given in table 1.

Vegetation

Most of Creek County had a forest-savanna vegetation known as the Cross Timbers.² Open stands of post oak, blackjack oak, and hickory grew among tall grasses. Many grassy openings were on the more clayey soils and along the foot slopes above the drainageways. Since this area became settled, the blackjack oak has spread considerably and occupied many areas that were formerly open. Much of this newer growth is small and brushy and nearly crowds out the grass.

Open prairies of bluestems, Indiangrass, and switchgrass occupy the deeper loams and clay loams and many of the shallow stony clay loams on steep slopes over interbedded clay shales and sandstones. The largest prairies occur in the eastern part of the county. The prairies were originally covered with a thick growth of coarse bunchgrasses, buffalograss (*Buchloe dactyloides*), and grama grasses. Scattered oak and sumac shrubs grew on the shallower soils. The bunchgrasses were mainly little bluestem (*Andropogon scoparius*), big bluestem (*A. gerardi*), broomsedge (*A. virginicus*), silver beardgrass (*A. saccharoides*), switchgrass (*Panicum virgatum*), and Indiangrass (*Sorghastrum nutans*). The grama grasses were mostly side-oats grama (*Bouteloua curtipendula*), hairy grama (*B. hirsuta*), and blue grama (*B. gracilis*).

All of the prairies in this county are excellent rangeland, but the deeper gently sloping soils are superior to the shallow or sloping soils. Native prairie meadows that are in excellent condition produce moderate yields of nutritious hay if the grass is cut at the right stage of growth. Many native prairie pastures and meadows have been poorly managed and now contain a high proportion of three-awn grass (*Aristida oligantha*) and weeds. The grazing is poor on such fields and the hay is of inferior quality.

The trees of the Cross Timbers consisted mainly of blackjack oak (*Quercus marilandica*), post oak (*Q. stellata*), elm (*Ulmus* sp.), and hickory (*Hicoria alba*) on the sandy soils of the uplands. On the terraces the forest was red oak (*Q. rubra*), pecan (*Carya pecan*), black oak (*Q. velutina*), elm, hickory, post oak, and blackjack oak. The bottom lands supported a fairly thick cover of elm, hack-

SOIL SURVEY

Creek County Oklahoma

UNITED STATES DEPARTMENT OF AGRICULTURE
Soil Conservation Service
In cooperation with the
OKLAHOMA AGRICULTURAL EXPERIMENT STATION

developed from weakly granular structure; friable when moist, very hard and compact when dry; slightly acid.

8 to 24 inches, grayish-brown heavy clay, mottled with yellowish red and yellowish brown; weak blocky structure; very compact and very sticky when moist, extremely hard when dry; very slowly permeable; medium acid.

10 to 12 inches, mottled gray and light olive-brown heavy clay, very sticky and stiff when wet; very slowly permeable; lightly acid in upper part, neutral in lower part.

The thickness of the surface soil ranges from about 8 to 18 inches, and the texture ranges from very fine sandy loam to loam. On a few low sandy mounds the surface soil is fine sandy loam 18 to 30 inches thick. The third layer ranges from dense clay to compact, slowly permeable sandy clay; in places it contains pockets and streaks of sandy loam.

Use and management (Capability unit IIs-1).—This soil is not susceptible to erosion. Fertility is low to moderate. The soil remains wet and cold late in the spring, and when it dries the surface soil crusts and bakes. If the soil is not worked at exactly the right moisture content, large clods form that make it very difficult to maintain a good seedbed.

This soil is not well suited to most common field crops, but it is moderately well suited to native hay or pasture. Most of it is now used for pasture. About one-third of the soil is used for crops, mostly cotton, corn, and sorghums. This soil is in the Claypan prairie range site.

Oil-waste land

Oil-waste land (Oa).—The areas mapped in this miscellaneous land type have been practically ruined for agricultural use by oil and salt-water waste from oil wells. They are more or less gullied and eroded and are almost bare of vegetation. They range in size from about one acre to several acres.

Use and management (Capability unit VIII).—This land is of no value for crops or pasture in its present condition. Some of the less strongly sloping and less severely gullied areas may eventually be revegetated by natural means if no more oil or salt-water waste is dumped on them.

Okemah series

These soils have developed from weakly alkaline shales and clays under a cover of grass in nearly level to gently sloping shallow valleys. They are moderately well drained, dark colored, and slightly acid. They have a dark-colored, crumbly and granular surface soil and upper subsoil. Their lower subsoil is mottled olive-yellow and very compact clay.

Okemah soils are not mapped separately in Creek County. They are closely associated with soils of the Dennis series in some places and with soils of the Woodson series in others, and are mapped in units with soils of one or the other of these series. The Woodson soils differ from the Okemah soils in being dark gray and having a claypan. The Dennis soils, where they are associated with the Okemah soils, lie in slightly higher positions and have developed from less clayey materials. The Dennis soils are browner than the Okemah soils, and they have more rapid runoff and internal drainage.

A profile of an Okemah soil as mapped with the Woodson soils is described under Okemah and Woodson clay loams, and a profile of an Okemah soil as mapped with

Dennis soils is described under Dennis and Okemah loams, gently sloping.

Okemah and Woodson clay loams (0 to 1 percent slopes) (Ob).—These two soils occur intermixed in small areas or separately in areas of several acres. Woodson clay loam occupies the nearly level, usually lower-lying parts of shallow valleys, and Okemah clay loam the gently sloping, slightly higher surrounding areas, but the two soils are so closely associated that it is not practical to map them separately. They merge with little or no difference in surface appearance. The parent materials of both soils are olive or olive and yellow weakly alkaline clays and shales. The mapping unit occurs mostly in shallow valleys near Kiefer, Mounds, and Edna. Runoff is slow to moderate, and internal drainage is very slow. The native vegetation was tall grasses, mainly big bluestem, little bluestem, side-oats grama, and Indiangrass.

Profile of Okemah clay loam near Mounds in the SW $\frac{1}{4}$ SW $\frac{1}{4}$ sec. 17, T. 16 N., R. 12 E.:

0 to 15 inches, dark-gray clay loam, lower part slightly mottled with brown; granular and friable when moist, very hard when dry; surface crusts in cultivated fields on drying; slightly acid.

15 to 20 inches, dark grayish-brown silty clay loam, slightly mottled with brownish yellow and strong brown; crumbly and friable when moist, sticky and plastic when wet; moderately permeable; slightly acid.

20 to 35 inches, mottled grayish-brown and light olive-brown heavy clay; very sticky and stiff when wet, extremely hard when dry; compact and very slowly permeable; neutral.

35 to 48 inches+, mottled light-gray and olive-yellow clay; very compact; very slowly permeable; weakly alkaline.

The texture of Okemah clay loam ranges from loam to clay loam. The depth to the heavy clay layer ranges from 18 to 25 inches. A few shotlike concretions of iron oxide occur in the two clay layers.

Profile of Woodson clay loam about 1 mile south of Kiefer in the SW $\frac{1}{4}$ SW $\frac{1}{4}$ sec. 28, T. 17 N., R. 12 E.:

0 to 12 inches, dark-gray clay loam; the 6-inch plow layer is slightly lighter in color; crumbly and friable when moist, very hard when dry; surface crusts on drying; slightly acid.

12 to 22 inches, dark-gray heavy clay, faintly mottled with brown; very compact claypan; very sticky and stiff when wet; very slowly permeable; slightly acid to neutral.

22 to 38 inches, dark grayish-brown clay, mottled with yellowish brown; very compact; extremely hard when dry; very slowly permeable; weakly alkaline.

38 to 46 inches+, mottled gray, olive-brown, and yellowish-brown clay or shaly clay; contains a few crystals of gypsum and small shotlike concretions of iron oxide; alkaline but not calcareous.

The thickness of the surface soil ranges from 10 to 14 inches. Considerable mottling occurs in the upper subsoil in the areas that grade toward the Okemah soil.

Some small areas of Parsons silt loam near Kiefer are included in this mapping unit. These areas have a dark grayish-brown silt loam surface soil 12 inches thick, which rests on a mottled grayish-brown, strong-brown, and pale-yellow claypan subsoil. The Parsons soils are not extensive enough in Creek County to be mapped separately and are not described in this report.

Use and management (Capability unit I-4).—The two soils in this mapping unit are the darkest colored and finest textured soils of the prairies. They are the most fertile and productive soils for common field crops that occur in the uplands of this county. Okemah clay loam is slightly more productive than Woodson clay loam. Both soils have a moderately high water-holding capacity

These inclusions consist of 10 to 18 inches of light-brown fine sandy loam over dark grayish-brown silt loam or clay loam, overlain by recent deposits of lighter colored, sandier soil materials.

Use and management (Capability unit IIIw-1).—This soil is moderately productive. It is easily worked and fairly resistant to drought. It is not susceptible to erosion, but some material may be deposited on the surface by flood waters. Cropping is hazardous because most areas are flooded several times a year.

This soil is moderately well suited to crops and, in spite of the flood hazard, about one-fifth of the area is cropped. Cotton, corn, and sorghums are the chief crops. This soil is well suited to pasture, and about one-third is used for this purpose. Nearly half has been left in native forest. The soil is in the Loamy bottom-land range site.

Reinach series

Soils of the Reinach series developed from alkaline to calcareous, reddish, silty to moderately sandy alluvium on low, nearly level stream terraces. They are moderately productive soils and easily worked. They are well suited to all general crops of this area, including alfalfa.

The Reinach soils have a brown to reddish-brown friable surface soil and a silty to moderately sandy subsoil. They are similar to the Yahola soils that occur on the present flood plains, but the Reinach soils lie a little higher and are above ordinary overflow. Their surface soil is darker than the Yahola surface soil, and is alkaline, though usually noncalcareous. Only one Reinach soil is mapped in Creek County.

Reinach very fine sandy loam (0 to 1 percent slopes) (Ra).—This soil occurs on low terraces or benches a few feet higher than the flood plains of the Cimarron River. It developed from reddish, silty to moderately sandy, alkaline, calcareous alluvial sediments. Prairie grasses and scattered elm, hackberry, pecan, and oak trees were the native vegetation. Runoff is slow, and internal drainage is moderate to rapid.

Profile of Reinach very fine sandy loam about $3\frac{1}{2}$ miles north of Drumright on a low terrace of the Cimarron River:

- 0 to 14 inches, reddish-brown very fine sandy loam; the 6-inch plow layer is light reddish brown; weak granular structure; very friable; neutral.
- 14 to 46 inches+, light reddish-brown very fine sandy loam that contains thin strata of reddish-brown and brown silt loam in lower part; friable; very permeable; neutral.

The surface soil ranges from brown to light reddish brown in color and from fine sandy loam to silt loam in texture. Some small areas next to more strongly sloping Teller soils have an overwash of light-brown, slightly acid fine sandy loam, 4 to 10 inches thick.

Use and management (Capability unit I-1).—This soil is well suited to crops and pasture. Most of it is cultivated. Corn, cotton, sorghums, and alfalfa are the principal crops. This soil is easily worked and is not susceptible to erosion. It is in the Loamy bottom-land range site.

Roebuck series

Soils of this series consist of only slightly modified clayey alluvium washed from prairie soils that developed over redbeds. The alluvial deposits are alkaline to weakly calcareous. The native vegetation was forest. Both

runoff and internal drainage are slow to very slow. Most areas are too poorly drained or too frequently flooded to be suitable for cropping unless artificially drained and protected from floods.

The surface soil is reddish brown. The subsoil is reddish clay, slightly mottled with brown and grayish brown. Roebuck clay is the only soil of this series that is mapped in Creek County.

Roebuck clay (0 to 1 percent slopes) (Rb).—This soil occupies parts of the flood plain of the Deep Fork River, where the channel is choked or partly filled by silting. It developed from clayey and silty, alkaline or calcareous, reddish alluvium. A native forest of elm, hackberry, oak, willow, pecan, and cottonwood covers these areas.

This is a poorly drained soil. Both runoff and internal drainage are very slow. The level flood plains are subject to frequent floods. This soil is not susceptible to erosion, but most areas are rapidly being covered with silt.

Profile of Roebuck clay:

- 0 to 20 inches, reddish-brown clay; moderately crumbly when moist, very sticky and plastic when wet; weakly alkaline.
- 20 to 45 inches+, reddish-brown heavy clay, slightly mottled with other shades of brown and some grayish brown; very sticky and stiff when wet, very hard when dry; slowly permeable; weakly calcareous.

Small areas have recent deposits of reddish-brown or brown, alkaline or calcareous, somewhat stratified clay loam and clay, 5 to 15 inches thick. In some places the subsoil below about 30 inches is stratified with brown clay loam and dark-gray calcareous clay.

Use and management (Capability unit Vw-1).—Nearly all of this soil is still in woodland. It is very fertile and would be highly productive if it were drained and protected from flooding, but drainage and flood protection are so difficult as to be almost impossible. Clearing underbrush and culling trees to allow native pecan orchards and bermudagrass pastures to develop may be practical. This soil is in the Heavy bottom-land range site.

Stephenville series*

Soils of this series are of medium depth over the parent materials of soft reddish sandstone or interbedded sandstone and sandy shale. They developed under a scrubby forest of mixed blackjack oak and post oak. Scattered coarse grasses grew in open areas.

These soils are slightly acid. They have a light-colored friable sandy surface layer and a yellowish-red or red friable sandy clay loam subsoil. The subsoil grades into the parent material, usually at a depth of less than 3 feet.

The Stephenville soils occupy nearly level to moderately sloping areas and are closely associated with the very shallow Darnell soils. The two soils are similar in surface appearance, but the Stephenville soils are 20 to 36 inches deep and the Darnell soils are 5 to 20 inches deep over sandstone. Sandstone outcrops are common in both.

In this county, the Stephenville soils are mapped only in units with the Darnell soils. The two series have similar uses and are about equal in productivity.

Stephenville and Darnell fine sandy loams, gently sloping (2 to 4 percent slopes) (Sa).—Stephenville fine sandy loam occupies about 70 percent of this mapping unit. Small areas of Darnell fine sandy loam make up the other 30 percent. This unit is very extensive in the central, southern, and western parts of the county.

These shallow to moderately deep upland soils developed over reddish-yellow to red sandstone or interbedded sandstone and sandy shale. The parent materials were slightly acid to neutral. The native vegetation was a thin to moderately thick forest of scrubby blackjack oak and post oak, and a thin ground cover of bluestem grasses. Both soils are well drained. Runoff is slow to moderate, but internal drainage is moderate to rapid.

Profile of Stephenville fine sandy loam, gently sloping, under a moderately thick cover of scrubby post oak and blackjack oak and bluestem grasses, about 2 miles east of Depew in the SW $\frac{1}{4}$ SW $\frac{1}{4}$ sec. 9, T. 15 N., R. 8 E.:

- 0 to 4 inches, grayish-brown fine sandy loam; in plowed fields this layer is pale brown; weak granular structure; very friable; slightly acid.
- 4 to 12 inches, pale-brown light fine sandy loam; very friable when moist, nearly loose when dry; slightly acid.
- 12 to 28 inches, yellowish-red sandy clay loam; massive structure; crumbly and friable when moist, slightly sticky when wet; porous and permeable; medium acid.
- 28 to 35 inches, yellowish-red sandy clay loam, mottled with red; friable; permeable; contains small soft fragments of partly weathered sandstone; medium to slightly acid.
- 35 inches +, yellowish-red sandstone bedrock; slightly acid to neutral.

The depth to bedrock ranges from about 20 to 40 inches; normally it is less than 30 inches. A few small outcrops of the sandstone bedrock occur.

Profile of Darnell fine sandy loam in a cultivated field of about 2 percent slope, in the NW $\frac{1}{4}$ NW $\frac{1}{4}$ sec. 16, T. 15 N., R. 8 E.:

- 0 to 10 inches, pale-brown light fine sandy loam; structureless; very friable when moist, nearly loose when dry; slightly acid.
- 10 to 16 inches, reddish-yellow fine sandy loam, slightly heavier in lower part; structureless; friable; lower part contains small fragments of partly weathered sandstone; medium acid.
- 16 inches +, reddish-yellow sandstone bedrock; neutral.

The depth of the Darnell soil ranges from about 5 to 20 inches. Most areas are between 8 and 15 inches deep. Small outcrops of sandstone bedrock occur here and there. The transition between the deeper Stephenville soil and the shallower Darnell soil is hardly noticeable; there is no change in slope or in color of the surface soil. Another profile of Darnell soil, as it typically occurs when associated with soils of the Pottsville series, is described under Darnell and Pottsville soils, sloping.

Use and management (Capability unit IIIe-2).—These soils are droughty and low in fertility. They are slightly to moderately susceptible to erosion if cultivated. Most of the cleared acreage has lost up to 20 percent of its surface soil through erosion. Some shallow gullies occur on the more strongly sloping cleared areas.

These soils are moderately well suited to crops and pasture. Yields are moderate under good management. Intensive management is needed to maintain or increase productivity.

About half of this mapping unit is cleared. Most of the cleared acreage has been abandoned for cropping, and it is now used for pasture. Cotton, peanuts, sorghums, corn, cowpeas, and sweetpotatoes are the principal crops. The pastures have a thin cover of three-awn grasses, bluestem grasses, and weeds. This unit is in the Sandy savanna range site. Nearly half of it is native woodland.

Stephenville and Darnell fine sandy loams, sloping (4 to 7 percent slopes) (Sb).—These soils are like Stephenville

and Darnell fine sandy loams, gently sloping, except that the surface soil is somewhat thinner, the bedrock is nearer the surface, and outcrops of sandstone are more common. About 60 percent of the acreage consists of Stephenville soils and about 40 percent of Darnell soils.

Use and management (Capability unit VIe-1).—This land is not well suited to crops. It is droughty, low in natural productivity, and highly erodible if cultivated. Moderate yields of common field crops are produced when the soils are first cultivated, but yields decline rapidly.

More than half of this mapping unit is still in woodland. The remainder has been cleared, but little is still used for crops. Cotton, corn, sorghums, peanuts, and cowpeas are grown. Yields are about three-fourths as much as on the gently sloping soils. Most of the acreage that was cleared, cultivated, and abandoned is now in pasture. The vegetation is three-awn grass and weeds. This unit is in the Sandy savanna range site.

If these soils are cultivated, very careful management is needed. They should be terraced, strip-cropped, and contour-cultivated, and erosion-resistant crops should be planted. Areas where the soils are too shallow to be terraced should be used for pasture.

Stephenville and Darnell fine sandy loams, sloping, severely eroded (4 to 7 percent slopes) (Sc).—The soils in this mapping unit have been so severely eroded that they are worthless for crops. Originally, they were like Stephenville and Darnell fine sandy loams, sloping, but erosion has removed much of the surface soil. Numerous gullies are now active; some cannot be crossed with tillage implements.

Use and management (Capability unit VIIe-2).—These soils were never well suited to crops, and now they are of no value for crops. All of the acreage has been cultivated, but most of it is now idle or in pasture. A thin stand of annual grasses and weeds furnishes poor grazing. It would take careful management to establish even moderately good pastures. Cotton, corn, sorghums, cowpeas, and peanuts are still grown on a few acres, but yields are low. This mapping unit is in the Eroded savanna range site.

Stidham series

The Stidham soils developed from acid sandy old alluvium on stream terraces under a mixed hardwood forest. They are low in natural fertility, but they are very responsive to management. They are well suited to fruits, special crops, and field crops.

Soils of this series have a light brownish-gray to pale-brown, friable, acid surface soil. The subsoil is yellowish-brown friable sandy clay loam, mottled with light gray and strong brown in the lower part.

Stidham soils are closely associated with Dougherty soils, which have a reddish subsoil, and with Eufaula soils, which have no loamy subsoil within 4 feet of the surface. In Creek County, the Stidham soils are not mapped separately. They are mapped in units with soils of the Dougherty series. A profile of a Stidham soil is described under Dougherty and Stidham fine sandy loams, nearly level.

Talihina series

The Talihina soils developed from beds of slightly acid to neutral, gray, brown, and olive shale that included a little sandstone. They are very shallow, slightly acid

grasses and scattered elm, hackberry, and mesquite trees grew on these soils. Runoff is slow, and internal drainage is moderate. This soil is closely associated with Teller silt loam, nearly level, but it has a darker colored surface soil and a brown or yellowish-brown, instead of a red, subsoil.

Profile of Vanoss silt loam, nearly level, in a cultivated field about 3 miles east of Oilton in the NE $\frac{1}{4}$ sec. 34, T. 19 N., R. 7 E.:

- 0 to 16 inches, dark grayish-brown silt loam; the 6-inch plow layer is slightly lighter in color; moderate granular structure; friable when moist, hard when dry; neutral.
- 16 to 28 inches, dark-brown clay loam; medium granular structure; crumbly and friable when moist, hard when dry; permeable; neutral.
- 28 to 38 inches, brown clay loam, faintly mottled with strong brown; crumbly and friable; permeable; neutral.
- 38 to 48 inches +, yellowish-brown clay loam; slightly more friable and noticeably more sandy than layer above; neutral to weakly alkaline.

The surface soil ranges in color from very dark grayish brown in undisturbed areas to grayish brown in cultivated fields, and in texture from very fine sandy loam to heavy silt loam. In areas where this soil grades toward the Teller soils, the upper subsoil is brown and the lower subsoil is strong brown to reddish brown.

A few small level areas of Brewer silt loam are included in this mapping unit. These areas have a dark-gray silt loam surface soil 14 inches thick over a dark-gray crumbly clay subsoil. Brewer soils are not mapped separately in Creek County, and they are not described in this report.

Use and management (Capability unit I-3).—This is a moderately productive, easily worked soil. It responds well to good management, and it is not susceptible to erosion.

This soil is excellent for crops and well suited to pasture. About three-fourths of it is cultivated. The principal crops are cotton, corn, sorghums, and oats. The rest is used for pasture. This soil is in the Loamy prairie range site.

Vanoss silt loam, gently sloping (2 to 4 percent slopes) (Va).—This soil is similar to Vanoss silt loam, nearly level, but its slope makes it slightly susceptible to erosion if cultivated. It occurs in small areas in association with nearly level Vanoss and Teller soils.

Use and management (Capability unit IIe-1).—More than half of this soil is used for crops. The same crops are grown as on Vanoss silt loam, nearly level, but yields are slightly lower. Eroded areas are 10 to 20 percent less productive than the normal soil. Good management would restore the original productivity in 2 or 3 years. This soil is in the Loamy prairie range site.

Verdigris series

These soils occupy the flood plains of streams. The alluvium from which they developed came mostly from dark soils of the prairies; some came from light-colored soils. Soils of this series are moderately well drained, but they are flooded occasionally to frequently. The periodic floods do not prevent successful cultivation except in the narrow flood plains of small streams.

These soils have a dark grayish-brown, friable, slightly acid surface soil and a dark grayish-brown clay loam subsoil. The subsoil is slightly mottled and somewhat finer textured in the lower part. Verdigris soils are

darker colored than the Pulaski soils and have more retentive, less sandy subsoils. They are similar to the Mason soils, which lie slightly higher and are above ordinary overflow.

Verdigris fine sandy loam (0 to 1 percent slopes) (Vd).—This soil occupies parts of narrow flood plains, mainly in the central and western parts of the county. The parent materials were slightly acid to weakly alkaline alluvial sediments, most of which were washed from dark soils of the prairie; some were derived from light-colored soils of forested areas. Runoff is slow, and internal drainage is moderate. These soils are flooded for short periods several times a year. Fresh alluvial sediments are deposited on most areas during floods. Native forests of elm, hackberry, oak, pecan, and cottonwood grew on these soils, and some coarse grasses and shrubs covered the ground.

Profile of Verdigris fine sandy loam:

- 0 to 14 inches, grayish-brown fine sandy loam, weakly stratified in lower part with dark grayish-brown silt loam; very friable when moist; slightly acid.
- 14 to 32 inches, dark grayish-brown clay loam; crumbly and friable when moist, moderately sticky when wet; slightly acid to neutral.
- 32 to 50 inches +, dark grayish-brown clay loam, mottled or splotted with light brown; contains thin seams or lenses of light-brown fine sandy loam below about 40 inches; neutral.

Most areas of this soil are covered by recent alluvium, 5 to 15 inches thick. This alluvium ranges from brown to dark grayish brown in color. The texture is fine sandy loam. It is somewhat stratified below plow depth. The clay loam subsoil is dark gray or dark grayish brown in most places.

Use and management (Capability unit I-2).—This is a moderately productive soil. It is likely to be flooded late in spring; consequently, cropping is uncertain. This soil does not erode, but a considerable amount of soil material is deposited by floodwater. Areas where floods are least frequent are well suited to crops. Corn, cotton, and sorghums are the most common crops. The soil is also well suited to pasture. Two-thirds of the acreage has been cleared for crops and pasture, and one-third is still under native forest. This soil is in the Loamy bottom-land range site.

Verdigris silt loam (0 to 1 percent slopes) (Ve).—This soil is mapped on flood plains of streams throughout the county. The parent material consisted of slightly acid to weakly alkaline alluvial sediments washed from dark soils of the prairies. The native vegetation was a hardwood forest of elm, oak, hackberry, cottonwood, and pecan trees, and scattered coarse grasses. Runoff is slow, and internal drainage is moderate. This soil is flooded one to three times a year; nevertheless, most of it can be successfully cropped.

Profile of Verdigris silt loam in a cultivated field about 4 miles west of Bristow in the SW $\frac{1}{4}$ SW $\frac{1}{4}$ sec. 34, T. 16 N., R. 8 E.:

- 0 to 16 inches, dark grayish-brown silt loam; friable and easily worked when moist, hard when dry; slightly acid.
- 16 to 36 inches, dark grayish-brown clay loam, faintly mottled with brown in the lower part; crumbly and friable when moist, hard when dry; porous and permeable; slightly acid to neutral.
- 36 to 46 inches +, dark grayish-brown clay loam, splotted or mottled with brown and gray; friable; permeable; weakly alkaline.

The surface layer is 10 to 20 inches thick. In some places the lower part of this layer is weakly stratified with fine sandy loam and clay loam. The subsoil is slightly acid to weakly alkaline. Stratified darker colored and lighter colored sediments may occur in the lowest layer.

Use and management (Capability unit I-2).—This soil is well suited to crops or pasture. It is somewhat more productive than Verdigris fine sandy loam. It is not susceptible to erosion, but soil material may be deposited on the surface by floods. The flood-deposited material replenishes the supply of plant nutrients. About one-fourth of this soil is still under native forest. Half of the remainder is cropped, mostly to corn, cotton, sorghums, and alfalfa. Yields range from almost complete failures to very high yields. Some of the soil is in pasture. This soil is in the Loamy bottom-land range site.

Verdigris clay loam (0 to 1 percent slopes) (Vc).—This soil occurs on the wider flood plains of the larger creeks of the county. The alluvial sediments from which it developed are slightly acid to weakly alkaline. They were washed from dark-colored soils of the prairies. Runoff is slow, and internal drainage is moderate. The native vegetation was a forest of elm, hackberry, ash, oak, pecan, and cottonwood, and coarse grasses.

Profile of Verdigris clay loam about ½ mile southeast of Sapulpa in the NW¼SW¼ sec. 6, T. 17 N., R. 12 E.:

- 0 to 20 inches, dark grayish-brown clay loam; moderately granular structure; crumbly and friable when moist, hard when dry; porous; slightly acid.
- 20 to 38 inches, grayish-brown clay loam, slightly mottled with brown and some pale brown; friable; permeable; slightly acid.
- 38 to 46 inches +, grayish-brown clay loam, mottled with other shades of brown; contains pockets and thin seams of brown fine sandy loam; slightly acid.

The color of the surface layer ranges from very dark brown in undisturbed areas to dark grayish brown or dark brown where cultivated. Small areas have a 3- to 5-inch layer of grayish-brown loam that has been deposited on the surface by floodwaters.

Use and management (Capability unit I-2).—This is a highly productive soil. Most of the areas are flooded one to three times a year, but this does not prevent their use for cultivated crops. This soil is not susceptible to erosion, but on most areas soil material is deposited during floods.

About one-third of this soil is cultivated. Corn, cotton, and sorghums are the principal crops. About one-fourth is in woodland. The rest is idle or used for pasture. This soil is in the Loamy bottom-land range site.

Woodson series

These are claypan soils that developed from alkaline or weakly calcareous shales and clays on nearly level to gently sloping prairies. They occupy small nearly level areas in gently sloping shallow valleys. These soils are dark grayish brown to dark gray. They are slightly acid.

Woodson soils are closely associated with soils of the Okemah series. The two series differ little in surface appearance. The Woodson soils have a thinner and more granular surface soil than the Okemah soils, and they have a dark-gray claypan subsoil. Woodson soils are not mapped separately in this county. Areas of Woodson clay loam are included in Okemah and Woodson clay loams, and a profile of the Woodson soil is described under that unit.

Yahola series

These soils occur on the flood plains of the Deep Fork and Cimarron Rivers and other large streams. The parent material was alluvium derived from grassland soils underlain by redbeds. Soils of the Yahola series have a reddish-brown alkaline or calcareous surface soil and a moderately sandy subsoil.

These soils are moderately to highly productive. Areas that are not flooded too often are well suited to general field crops. Yahola soils are similar to Port soils in surface appearance, but they have a sandier subsoil. They are more alkaline than Pulaski soils. Yahola soils have a sandier subsoil and more rapid internal drainage than the Roebuck soils.

Yahola very fine sandy loam (0 to 1 percent slopes) (Yb).—This soil occurs on the flood plains of the Cimarron and Deep Fork Rivers. It developed from calcareous or alkaline sandy alluvial sediments washed from prairies underlain by redbeds. Runoff is slow to moderate, and internal drainage is moderate to rapid. All areas of this soil are periodically flooded. Those on the flood plain of the Deep Fork River are too frequently flooded to be suitable for crops, and they have been left in native hardwood forest. The native vegetation was a forest of elm, ash, oak, cottonwood, and pecan trees. Coarse grasses grew where the forest was thin.

Profile of Yahola very fine sandy loam about ½ mile north of Oilton in the NW¼SW¼ sec. 28, T. 19 N., R. 7 E.

- 0 to 16 inches, reddish-brown very fine sandy loam; structure less; very friable; alkaline but not calcareous.
- 16 to 46 inches +, reddish-yellow light fine sandy loam, weakly stratified in the lower part with loamy fine sand; very friable and freely permeable; alkaline but not calcareous

The surface soil is alkaline or calcareous. In color it ranges from light brown to reddish brown and in texture from fine sandy loam to silt loam. Small areas where floodwaters have recently deposited sediments may be weakly stratified.

Use and management (Capability unit I-2).—This soil is easily worked and moderately productive. Areas that are not flooded too often are well suited to crops. The soil is not susceptible to erosion. It receives fresh deposit of soil material during floods.

All of the cropland is on the flood plain of the Cimarron River. Cotton, corn, and sorghums are the principal crops. This soil is in the Loamy bottom-land range site.

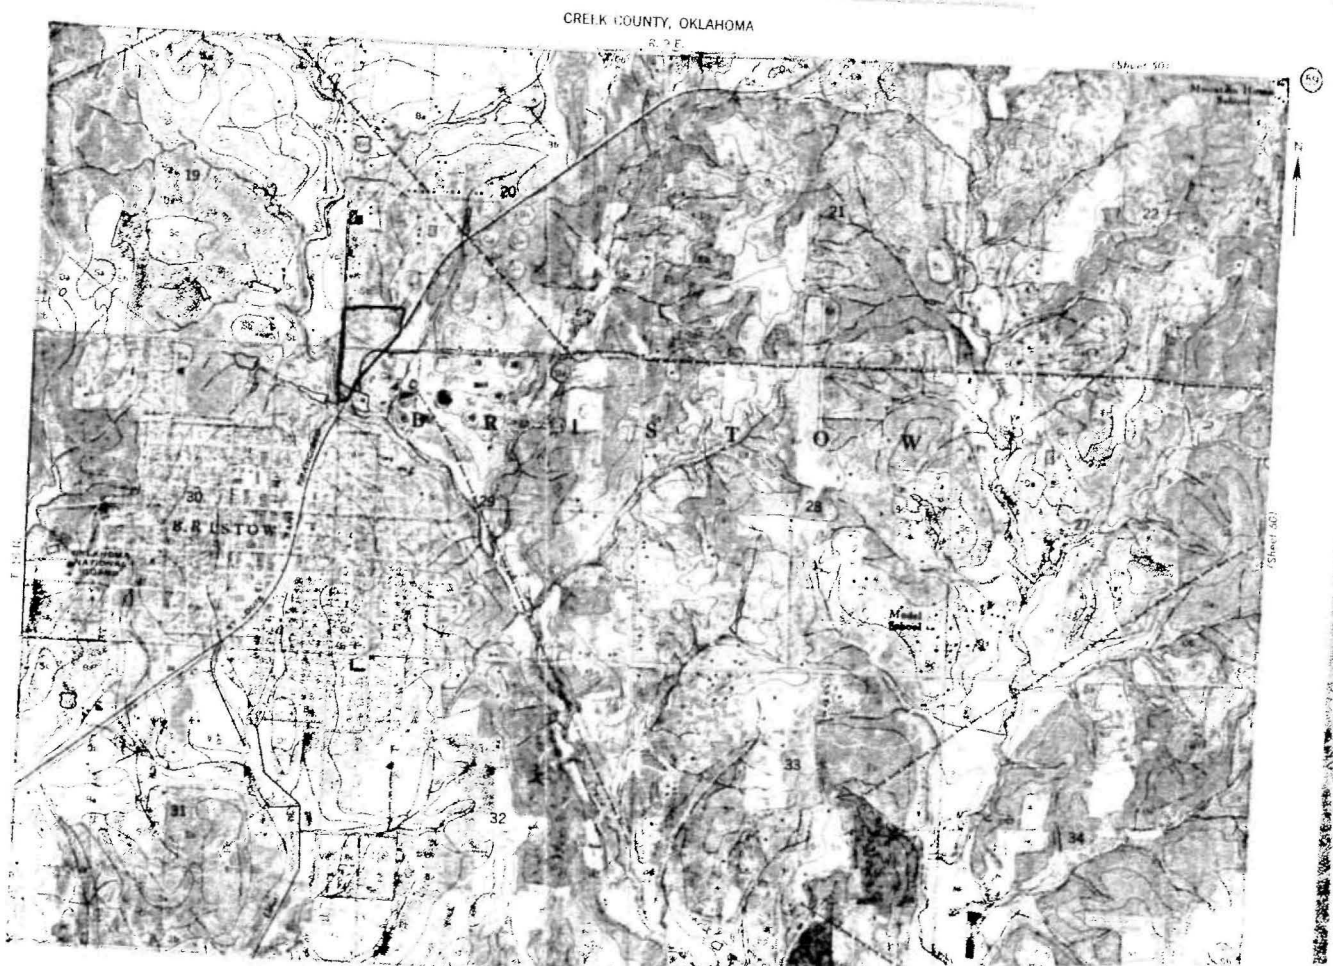

Yahola clay loam (0 to 1 percent slopes) (Ya).—This soil developed from reddish, calcareous, sandy alluvium on the flood plains of the Deep Fork and Cimarron Rivers. The native vegetation was a forest of elm, hackberry, oak, pecan, cottonwood, and ash. Coarse grasses grew where the forest was thin. Runoff is slow but internal drainage is rapid through the sand substratum.

This soil is associated with Yahola very fine sandy loam. It is like that soil except for having a finer textured surface soil.

Profile of Yahola clay loam:

- 0 to 14 inches, reddish-brown clay loam; crumbly and friable when moist, moderately sticky when wet; alkaline or weakly calcareous.
- 14 to 45 inches +, reddish-yellow very fine sandy loam, weakly stratified in lower part with loamy sands and clay loam; very permeable; weakly calcareous.

Memorandum

July 10, 2008

To: Lorraine Refinery, PA File

From: Kerry Paul, Technical Intern

Re: Generalized Geology and Hydrogeology
Lorraine Refinery
S1/2 SW1/4 SW1/4 Sec20 T16N R9E IM
NW1/4 NW1/4 NW1/4 Sec29 T16N R9E IM
Creek County, Oklahoma

Climate

Creek County is in the Central Lowland physiographic province. The summers are hot and the winters are cool. The mean annual precipitation is 37 inches and the average annual runoff is 5 inches.

Geology

The Lorraine Refinery sits on the Pennsylvanian-aged Barnsdall Formation. This formation is composed of fine-grained sandstone overlain by shale. Thickness ranges from 80 to 200 ft.

At approximately 0.25 miles to the southeast of the refinery, the underlying Pennsylvanian-aged Wann Formation and underlying Iola Limestone are exposed. The Wann Formation varies in thickness from 40 to 180 feet and is comprised of shale and fine- to medium-grained sandstone. The Iola Limestone ranges in thickness from 15 to 20 feet and consists of a calcareous fine-grained sandstone and limestone with some shale.

Sand Creek flows southward along the western side of the Lorraine Refinery site and begins flowing to the southeast at the southern boundary of this site. At approximately 0.25 miles to the southeast of the refinery Sand Creek is associated with Quaternary-aged alluvial deposits consisting of sand, silt, clay, and lenticular beds of gravel. Thickness in these deposits ranges from 5 to 50 feet (25 feet average). Because Sand Creek crosses the site, localized alluvium may be present at the refinery.

The regional dip is to the northwest at approximately 40 feet per mile.

Hydrogeology

The Lorraine Refinery is located on the border between the recharge and potential recharge area of a major bedrock aquifer - the Pennsylvanian, Vamoosa Formation and Ada Group, comprised of fine- to coarse-grained sandstone irregularly interbedded with shale. A potential recharge area includes strata that may be in hydrological communication with the bedrock aquifer, so these regions should be protected as well as the recharge area proper. In 2000, 7.34 million gallons of freshwater per day were withdrawn from the Vamoosa-Ada groundwater aquifer, 75 percent of

which was used for municipal purposes and 25 percent for rural domestic and stock animal consumption. This quantity is significant and represents 10 percent of the fresh groundwater withdrawal in Oklahoma for this year.

A field of eight wells, which may be the public water supply for Bristow, Oklahoma, is located approximately 1.5 miles south of the refinery site. The average well is 200 feet deep and has a water level at 45 feet. The average yield from these wells is 25 to 50 gallons per minute (gpm). Water quality, obtained from Pennsylvanian rocks, is good with 500 mg/L or less of dissolved solids.

The Lorraine Refinery is located 2 miles from Little Deep Fork Creek, which is associated with the alluvial and terrace deposits of a groundwater recharge area. These deposits range in thickness from 10 to 50 feet. The yields from these aquifers are, generally, 10 to 500 (gpm) of good quality (less than 1,000 mg/L dissolved solids) water. Little Deep Fork Creek flows to the southeast, draining into the Deep Fork River, a tributary of the North Canadian River.

Depth to shallow ground water is 12 to 20 feet, according to records of monitoring wells located within two miles of the site. Based on regional topography, flow direction of surface and shallow ground water is to the south/southeast.

FACT SHEET

Creek County, Oklahoma

2006 American Community Survey

Data Profile Highlights:

NOTE. Income and Poverty data from the 2007 American Community Survey (ACS) are available from the data sets page. Additional data are scheduled to be released in September.

NOTE. Although the American Community Survey (ACS) produces population, demographic and housing unit estimates, it is the Census Bureau's Population Estimates Program that produces and disseminates the official estimates of the population for the nation, states, counties, cities and towns and estimates of housing units for states and counties.

Social Characteristics - show more >>	Estimate	Percent	U.S.	Margin of Error
Average household size	2.53	(X)	2.61	+/-0.07
Average family size	2.98	(X)	3.20	+/-0.14

Building 7
Oklahoma City, Oklahoma 73101

Dear Mr. Christenson:

The purpose of this letter is to request information regarding the location and use of wells located in the areas listed on the attached page. The information provided by your office will be used to partly describe ground water targets for a CERCLA Preliminary Assessment that will be conducted by the DEQ (Site Assessment Unit), as authorized by a cooperative agreement with the U. S. Environmental Protection Agency.

Your assistance is greatly appreciated. If you have any questions, please call Hal Cantwell at (405)702-5139. Please direct your response to Hal Cantwell, Land Protection Division as well.

Sincerely,

Jennifer Larsen

LAND PROTECTION DIVISION
DEPARTMENT OF ENVIRONMENTAL QUALITY

Dr. Jennifer Larsen
Oklahoma Department of Environmental Quality
P.O. Box 1677
Oklahoma City, OK 73101-1677

Dear Dr. Larsen:

Enclosed please find the data you requested. I retrieved data for all wells in the U.S. Geological Survey's National Water Information System (NWIS) database for the area of your request. I retrieved some data elements for all the wells in the U.S. Geological Survey's National Water Information System database for the area of your request; however, some additional data elements for some of these wells may be available. If you need additional data for these wells, further checking may be warranted.

Abbreviations used on the retrieval include:

Primary use of water

I = irrigation

U = unused

P = public supply

H = domestic

N = industrial

Aquifer code

332VMOS = Vamoosa Formation

323TLNT = Tallant Formation

323BRDL = Barnsdall Formation

322NLBL = Nellie Blye Formation

323WANN = Wann Formation

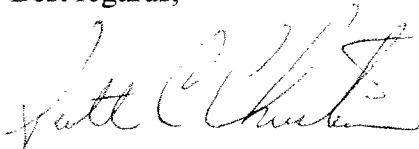

323DEWY = Dewey Limestone

I transferred from USGS in Oklahoma to USGS in Albuquerque, New Mexico in 2006. While I am still willing and able to assist you by retrieving data from the USGS NWIS database, it might be faster to contact the local USGS office for data retrievals. You can direct your requests to the Information Officer at the USGS Oklahoma City office. You

can also retrieve these directly from the USGS Oklahoma Water Science Center web site
at: <http://waterdata.usgs.gov/ok/nwis>

If I can be of further assistance to you, please feel free to contact me at the address shown
on the letterhead, by telephone (505.830.7963), or email (schris@usgs.gov).

Best regards,

A handwritten signature in cursive script, appearing to read "Scott C. Christenson".

Oklahoma has two systems of intersecting base lines and meridians: one for the Panhandle, and one for the major portion of the state. The division between the two systems is indicated by the dashed line on the state map to the left.

03N-03E-29 BCD 1

The standard method for describing the location of a data collection site by fractional section, section, township, and range, usually referred to as the legal description, is replaced in this report by a local identifier illustrated by this figure. By the legal method, the location of the site indicated by the dot would be described as SE $\frac{1}{4}$ SW $\frac{1}{4}$ NW $\frac{1}{4}$, Sec. 29, T. 3 N., R. 3 E. The method used in this report changes the order and indicates quarter subdivisions of the sections by letters. A sequence number is added to provide a unique local identifier for each site. By this method, the location of the site is given as 03N-03E-29 BCD 1.

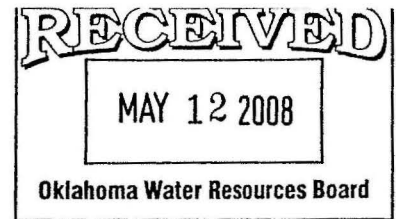

Figure 7.—Explanation of local identifier.

Oklahoma Water Resources Board
3800 N. Classen
Oklahoma City, Oklahoma 73118

Dear Ms. Adkisson:

The purpose of this letter is to request copies of domestic well logs for both private and municipal wells that are presumably active and are in the locations described on the attached sheet. Please include copies from your files, archive files, and permit application files; (copies of the actual well log are preferred and most helpful since they contain local geological information).

Copies of the well logs may be sent to the DEQ through inter-agency mail. The information provided by your office will be used to partly describe ground water targets for a CERCLA Preliminary Assessment that will be conducted by the DEQ (Site Assessment Unit), as authorized by a cooperative agreement with the U. S. Environmental Protection Agency.

Your assistance is greatly appreciated. If you have any questions, please call Hal Cantwell at 702-5139. Please direct your response to Hal Cantwell, Land Protection Division as well.

Date: May 15, 2008

To the Attention of: Ms. Jennifer Larsen
Environmental Programs Specialist I
Department of Environmental Quality

From: Theda Adkisson

The attached material or information is sent to you:

- ☒ **In response to your request**
☐ **For your information**
☐ **Please see note**

I've enclosed spread sheets of the requested well search in Creek County. If a report is required please follow the instruction on the attached "NOTICE TO WELL RECORDS SEARCH CUSTOMERS".

If I can be of further help, please let me know.

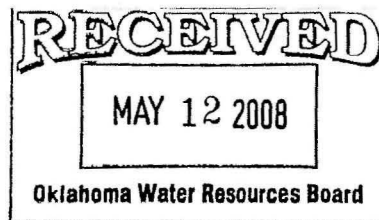

NOTICE TO WELL RECORDS SEARCH CUSTOMERS

The Oklahoma Water Resources Board is pleased to announce the availability of a web-based well record search application which is accessible through the agency's web site. **This service is free to the public.** The address for our web site is www.owrb.ok.gov

You will be able to search by the well id number, county, or legal location. You must then select the type and uses of the well records you are interested in finding. You can select all groundwater and/or monitoring well uses or only selected uses, such as public water supply wells. You can also select some other type of well record, such as groundwater test holes, geotechnical borings, etc. The search can be further modified to select wells you want which were completed before, on, or after a certain date.

The summary results of the search you have completed can be downloaded in a .csv format by clicking on the 'download search results' line near the top of the screen. This file can then be opened in Excel or other comparable spreadsheet.

From the results display screen you can also view the entire record for an individual well or boring by clicking on any one of the displayed well id numbers. The well construction data available for that well will be displayed which can then be printed.

STEVEN A. THOMPSON
Executive Director

Help & Search Results Key

This search does not necessarily contain information about all of the water wells within the area of interest. The multi-purpose well completion report database consists of information submitted to the Board for all well data reported by licensed firms since 1982 and monitoring well data reported since 1988. There could be other wells in the area, which are not included in our database. Wells drilled prior to the licensing requirements for well drillers would not necessarily have had a well log submitted to the OWRB. A field survey may need to be conducted to verify the presence or absence of other water wells.

The Oklahoma Water Resources Board does not guarantee the accuracy of the data shown in the well completion records. Data entered into the database are as reported by the well drillers and much of the data have not been field verified for accuracy. If any errors in the records are discovered, please bring them to our attention so that corrections to the database may be made.

Help & Search Results Key

This search does not necessarily contain information about all of the water wells within the area of interest. The multi-purpose well completion report database consists of information submitted to the Board for all well data reported by licensed firms since 1982 and monitoring well data reported since 1988. There could be other wells in the area, which are not included in our database. Wells drilled prior to the licensing requirements for well drillers would not necessarily have had a well log submitted to the OWRB. A field survey may need to be conducted to verify the presence or absence of other water wells.

The Oklahoma Water Resources Board does not guarantee the accuracy of the data shown in the well completion records. Data entered into the database are as reported by the well drillers and much of the data have not been field verified for accuracy. If any errors in the records are discovered, please bring them to our attention so that corrections to the database may be made.

Dear Mr. Sandbo:

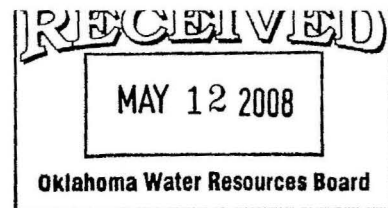

The purpose of this letter is to request any information regarding surface water intakes that may be located within 15 miles downstream from the point of entry (PPE) into perennial waters. Enclosed is the legal location of a **PPE** and **15-mile end** of a site. The information provided by your office will be used to partly describe surface water targets in CERCLA Preliminary Assessments that will be conducted by the DEQ (Site Assessment Unit), as authorized by a cooperative agreement with the U. S. Environmental Protection Agency.

Your assistance is greatly appreciated. If you have any questions, please call Hal Cantwell at 702-5139. Please direct your response to Hal Cantwell, Land Protection Division as well.

Sincerely,

Jennifer Larsen

Comments:

Re: PPE & 15-mile end for Lorraine Refinery

Enclosed is a map showing the area of concern per your letter dated April 30, 2008. It appears that there is only one permitted surface water diversion within the area stated. Please note that there may be others taking water for domestic purposes for their household use within the area that we are not aware of since we do not regulate domestic use of water.

If you have any questions or need further information, please feel free to contact me at 405-530-8800.

**TITLE 785. OKLAHOMA WATER RESOURCES BOARD
CHAPTER 45. OKLAHOMA'S WATER QUALITY STANDARDS**

Introduction:

This document contains the Oklahoma Water Quality Standards promulgated by the Oklahoma Water Resources Board including all amendments which are effective as of May 27, 2008. This document was prepared by Oklahoma Water Resources Board staff as a convenience to the reader, and is not a copy of the official Title 785 of the Oklahoma Administrative Code. The rules in the official Oklahoma Administrative Code control if there are any discrepancies between the Code and this document.

Subchapter	Section
1. General Provisions	785:45-1-1
3. Antidegradation Requirements	785:45-3-1
5. Surface Water Quality Standards	785:45-5-1
7. Groundwater Quality Standards	785:45-7-1

Appendix A.	Designated Beneficial Uses for Surface Waters
Appendix B.	Areas With Waters of Recreational and/or Ecological Significance
Appendix C.	Suitability of Water for Livestock and Irrigation Uses [REVOKED]
Appendix D.	Classifications for Groundwater in Oklahoma
Appendix E.	Requirements for Development of Site Specific Criteria for Metals
Appendix F.	Statistical Values of the Historical Data for Mineral Constituents of Water Quality (beginning October 1976 ending September 1983, except as indicated)
Appendix G.	Numerical Criteria to Protect Beneficial Uses
Appendix H.	Beneficial Use Designations for Certain Limited Areas of Groundwater

SUBCHAPTER 1. GENERAL PROVISIONS

Section	Purpose
785:45-1-1.	Purpose
785:45-1-2.	Definitions
785:45-1-3.	Adoption and enforceability of the standards
785:45-1-4.	Testing procedures
785:45-1-5.	Revision procedures
785:45-1-6.	Errors and separability

785:45-1-1. Purpose

(a) The Oklahoma Water Resources Board's statutory authority and responsibility concerning establishment of standards of quality of waters of the state are provided for under 82 O.S., §1085.30. Under this statute the Oklahoma Water Resources Board is authorized to promulgate rules *which establish classifications of uses of waters of the state, criteria to maintain and protect such classifications, and other standards or policies pertaining to the quality of such waters* [82:1085.30(A)]. These Standards are designed to maintain and protect the quality of the waters of the state.

(b) The Standards specify numerical and narrative criteria to protect beneficial uses designated for certain waters of the State. Beneficial use designations can be found in Appendix A of this Chapter for listed surface waters and in 785:45-5-3 for unlisted surface waters. The numerical and narrative criteria assigned to protect surface water beneficial uses are shown in Subchapter 5 of this Chapter. Classifications for groundwater can be found in Subchapter 7 and Appendix D of this Chapter. Narrative criteria to protect groundwater are shown in Subchapter 7 of this Chapter. The criteria that are the standards for a specific water of the State are the most stringent assigned to its designated beneficial uses. Since these criteria will protect the most sensitive use assigned, they will protect all designated uses. The

APPENDIX A. DESIGNATED BENEFICIAL USES FOR SURFACE WATERS

(a) **Introduction.** The Tables in the following Appendices A.1 through A.7 identify certain waterbodies throughout the state of Oklahoma and designate beneficial uses for those waterbodies. The waterbodies are identified by their name (e.g., "Horse Creek") or other description (e.g., "Tributary of Lebos Creek at Sec. 2, T2N, R 26W, IM", "Red River from the Arkansas State Line to the Kiamichi River") and a Waterbody ID Number. The Waterbody ID numbers are used in the State of Oklahoma "Water Quality Assessment Integrated Report" published by the Oklahoma Department of Environmental Quality. The first digit of the Waterbody ID number indicates the basin number; the next three digits indicate the major drainage segment within that basin; the next two digits indicate the subdivision of the major drainage segment, the next two digits indicate a smaller section of that six digit basin, and the last four digits represent a hydrologic sequence of waterbodies, going from the most downstream point in the eight-digit watershed up to the furthest upstream point in the watershed. In some cases, two additional digits are added to indicate further delineations within the waterbody segment. Not all waterbodies have a Waterbody ID number, primarily due to limited resources and need. Where a specific Waterbody ID has not been assigned, the six-digit Water Quality Management Segment is listed until such time as the waterbody is assigned a specific Waterbody ID number. The Tables in Appendices A.1 through A.7 also set forth columns to show the beneficial uses or subcategories of uses which are designated for each identified waterbody.

(b) **Beneficial Use designations.** Designations of beneficial uses for a waterbody are reflected in the Tables in Appendices A.1 through A.7 by the presence of the following codes or a dot ("•") in the columns to the right of the waterbody name. An empty space in a column means that column's beneficial use or subcategory thereof is not designated for that waterbody.

- (1) EWS - Emergency Water Supply beneficial use
- (2) PPWS - Public and Private Water Supply beneficial use
- (3) F&W Prop. - Fish and Wildlife Propagation beneficial use
 - (A) WWAC - Warm Water Aquatic Community subcategory
 - (B) HLAC - Habitat Limited Aquatic Community subcategory
 - (C) CWAC - Cool Water Aquatic Community subcategory
 - (D) Trout - Trout Fishery (put and take) subcategory
- (4) Ag - Agriculture beneficial use
- (5) Rec - Recreation beneficial use
 - (A) PBCR - Primary Body Contact beneficial use
 - (B) SBCR - Secondary Body Contact beneficial use
- (6) Nav - Navigation beneficial use
- (7) Aes - Aesthetics beneficial use

A dot ("•") used in a column indicates that the beneficial use in that column's heading is designated for that waterbody without a more specific subcategory or other designation.

The criteria to protect the beneficial uses are provided in Subchapter 5 and Appendix G of this Chapter.

[AGENCY NOTE: The following sections (c) and (d) were inadvertently omitted when this Appendix was amended in 2008. It is anticipated that these two sections will be re-adopted in the future. In the meantime, they are included here as an aid to the reader in understanding Appendices A.1 through A.7.]

(c) **Limitations for Additional Protection.**

- (1) Limitations for additional protection are described in 785:45-5-25.
- (2) Waterbodies that are subject to limitations for additional protection in 785:45-5-25 are identified by the designation of any of the following codes in the "Limitations" column to the right of the waterbody's name:
 - (A) "ORW" - indicates waters designated Outstanding Resource Waters;
 - (B) "HQW" - indicates waters designated High Quality Waters; and
 - (C) "SWS" - indicates waters designated Sensitive Public and Private Water Supplies.

RE: Ecological Information for CERCLA Preliminary Assessment, Creek Co., Oklahoma

Dear Ms. Larsen,

This responds to your letter of April 30th requesting information regarding ecological systems of importance within a 4-mile radius of the Lorraine Refinery Site and 15 miles downstream of the surface water PPE of the site occurring in Creek County, Oklahoma. Site specific information has been requested for the following legal descriptions:

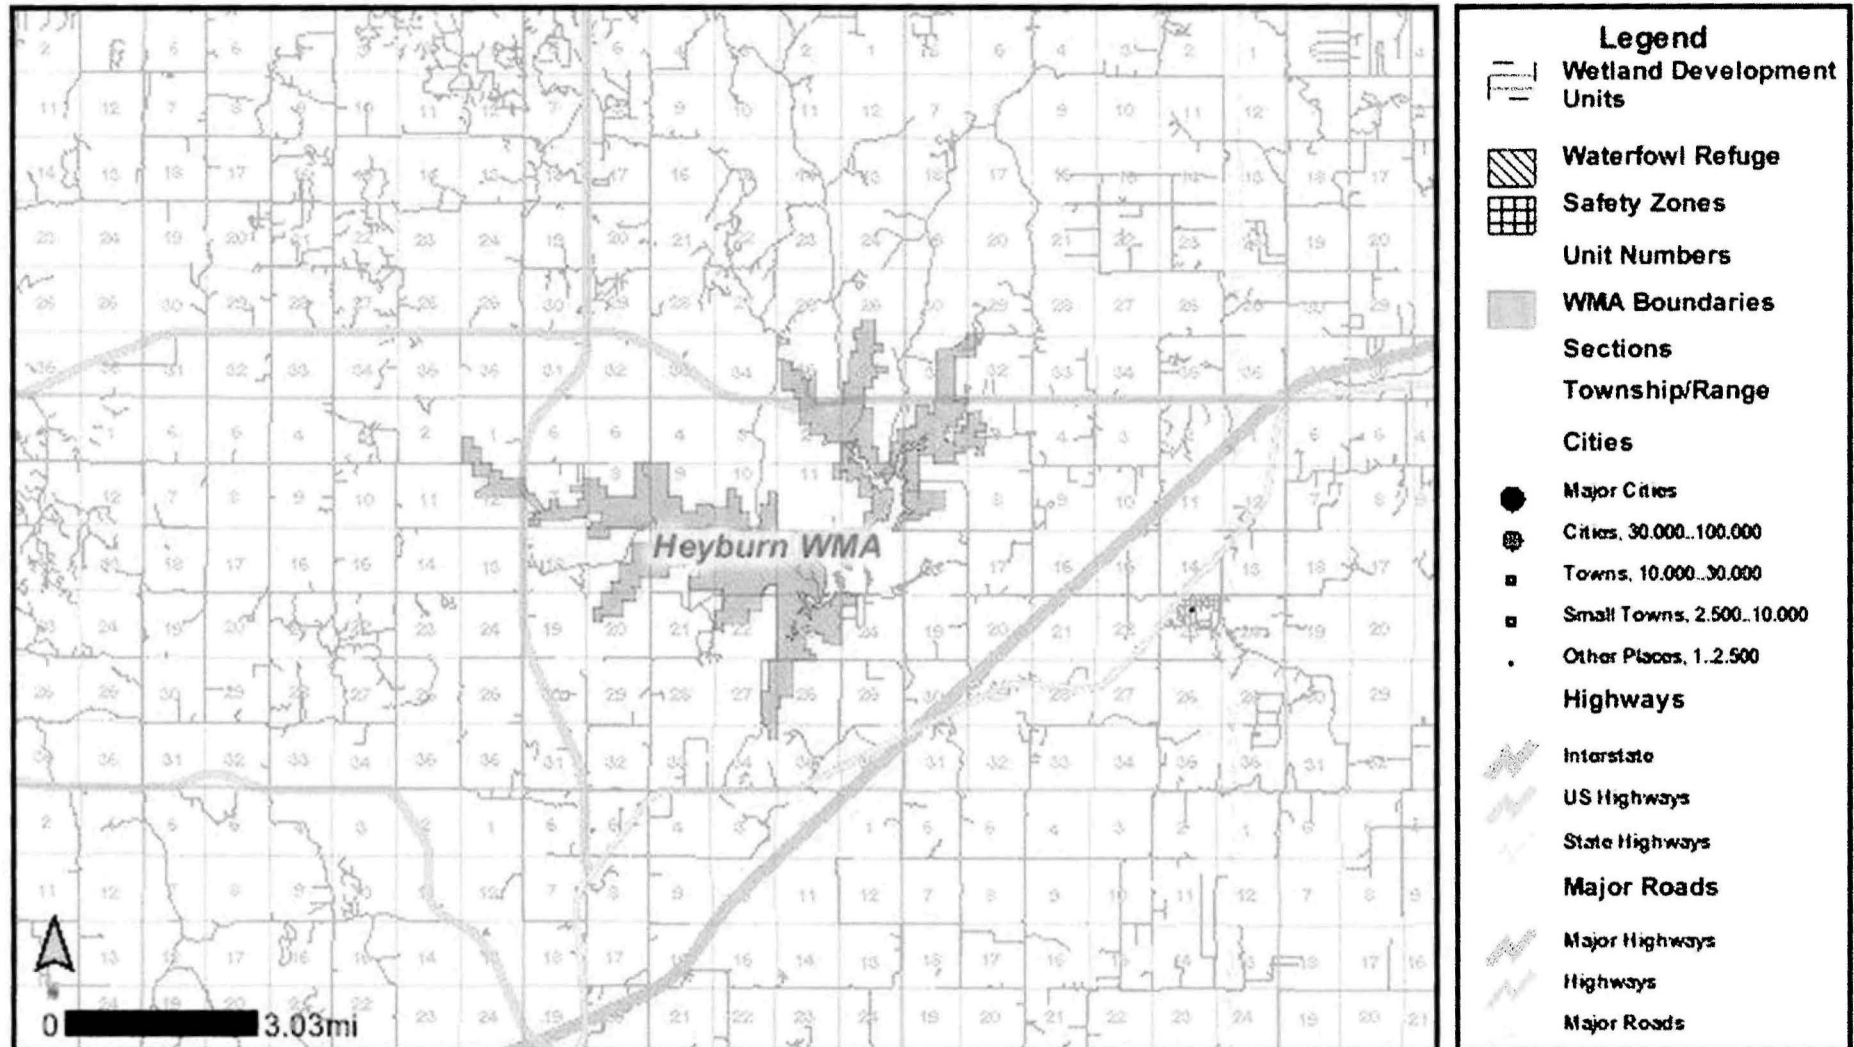

**Sections 31-33 T17N R9E;
Sections 3-11, 13-35 T16N R9E;
Sections 1-2, 10-15, 22-27, 34-36 T16N R8E;
Sections 6-8, 17, 20 T15N R10E;
Sections 1-12, 17-18 T15N R9E;
Sections 1-3, 11-12 T15N R8E;**

Please understand that, due to financial and personnel constraints, the Oklahoma Department of Wildlife Conservation (ODWC) has not conducted an actual field survey of the proposed project. However, based on our review of the material provided and our current records to determine presence and/or impacts on state-listed threatened or endangered species, species of special concern, critical habitat or Wildlife Management Areas (WMAs) two (2) federally listed species, three (3) state listed species, and one (1) WMA were found that may be effected by this site.

The Species of Special Concern Category 2 (SSII) Prairie Mole Cricket (*Gryllotalpa major*), Bachmann's Sparrow (*Aimophila aestivalis*), and Woodchuck (*Marmota monax*) have been known to occur in the area and may be affected by this project. A SSII is a species that has been identified by technical experts as possibly threatened or extirpation but for which additional
